**(54) Title:** GLYCONJUGATES COMPRISING CARBOHYDRATE EPITOPES, METHODS FOR THEIRSYNTHESIS, AND THEIR USE FOR THE TREATMENT OR PROPHYLAXIS OF CANCER

 $x = 20-600$ 

**(57) Abstract:** The present invention provides novel glycosides and glycoconjugates, glycoamino acids, and methods for the synthesis thereof. In another aspect, the present invention provides novel clustered glycopeptides and methods for the synthesis thereof. In still another aspect, the present invention provides methods for the treatment of cancer, preferably for the prevention of recurrence of cancer, and methods for inducing antibodies in a subject, comprising administering to a subject in need, an effective amount of any of the inventive glycopeptides as disclosed herein, either in conjugated form or unconjugated and in combination with a suitable immunogenic carrier.

Eurasian patent (AM, AZ, BY, KG, KZ, MD, RU, TJ, TM),  
European patent (AT, BE, BG, CH, CY, CZ, DE, DK, EE,  
ES, FI, FR, GB, GR, HU, IE, IT, LU, MC, NL, PT, RO,  
SE, SI, SK, TR), OAPI patent (BF, BJ, CF, CG, CI, CM,  
GA, GN, GQ, GW, ML, MR, NE, SN, TD, TG).

**GLYCONJUGATES COMPRISING CARBOHYDRATE EPITOPES,  
METHODS FOR THEIR SYNTHESIS, AND THEIR USE FOR THE  
TREATMENT OR PROPHYLAXIS OF CANCER**

**Priority Information**

[0001] The present application claims priority to U.S. Application No.: 10/209,618 filed July 31, 2002, which is a continuation-in-part of co-pending patent application 09/641,742 filed August 18, 2000, which claims priority under § 119(e) of the United States Code to provisional application 60/150,088, filed August 20, 1999, entitled "Synthesis and Bioconjugation of the n-Pentenyl Glycoside of the Tumor-Associated Antigen Fucosyl GM1", each of which is hereby incorporated by reference in its entirety.

**Government Support**

[0002] The present invention was supported by the National Institutes of Health Grant Numbers: AI16943 and CA28824. Therefore, the government has certain rights in the present invention.

**Background of the Invention**

[0003] The improvement of existing therapeutics and the development of novel therapeutics to treat and/or prolong survival of cancer patients has been the subject of continuing research in the scientific community. Although certain of these efforts have been directed to "traditional" chemotherapeutics (*e.g.*, Paclitaxel and other small molecule and/or natural product based therapies) that act by killing malignant cancer cells, it has also been a long-standing goal (Lanzavechis, *Science*, **260**, 937-944; Pardoll *et al.*, *Curr. Opin. Immunol.* **1993**, 5, 719-725; Livingston *et al.*, *Curr. Opin. Immunol.* **1992**, 4, 2; Dranoff *et al.*, *Proc. Natl. Acad. Sci. USA* **1993**, 90, 3539; M.H. Taoet *et al.*, *Nature*, **1993**, 362, 755; T. Boon, *Int. J. Cancer* **1993**, 54, 177) to develop an anti-cancer vaccine that will induce an anticancer immune response. Although cancer vaccines have thus far been perceived as a mode of treatment subsequent to the detection of the disease (for example, by providing an enhanced immunological response), it would be most desirable to develop a selective vaccine that would be able to provide enhanced protection against tumor recurrence and metastasis, for example when the tumor burden has been addressed through surgery, radiation or other chemotherapeutic treatment.

[0004] In general, tumor immunotherapy is based on the theory that tumors possess specific antigens that can be recognized when presented to or processed by a properly trained immune system. The goal for the development of an effective anticancer vaccine is to break the tolerance which the immune system has for these antigens expressed mainly or exclusively by the tumor. One approach researchers have taken has been to present glycoconjugate versions of the antigens, to induce an effective immune response. In an effort to achieve this goal, identified cancer carbohydrate antigens such as TF, Tn, sTN, KH-1, Le<sup>y</sup> and Globo-H have been carefully characterized as being over-expressed at the surface of malignant cells in a variety of cancers (breast, colon, prostate, ovarian, liver, small cell lung and adenocarcinomas). In addition, they have been immunocharacterized by monoclonal antibodies and therefore have relevant serological markers available for immunological studies. Such studies have suggested that patients immunized in an adjuvant setting with carbohydrate-based vaccines produce antibodies reactive with human cancer cells, and that the production of such antibodies prohibits tumor recurrence and correlates with a more favorable diagnosis (see, Livingston *et al.*, *J. Cancer Res.* **1989**, *49*, 7045; Ragupathi, G. *Cancer Immunol. Immunother.* **1996**, *43*, 152). Additionally, the isolation and careful structural identification of specific carbohydrate antigens overexpressed in cancer cells has provided a framework for an attack using carbohydrate-based tumor immunotherapy (For reviews see (a) Hakomori, S.; Zhang, Y. *Chem. Biol.* **1997**, *4*, 97; (b) Toyokuni, T.; Singhal, A. K. *Chem. Soc. Rev.* **1995**, *24*, 23 and references therein).

[0005] A major drawback in using carbohydrate epitopes, however, is that they are generally not readily available by isolation from natural sources. For example, the immense difficulties associated with their purification from natural sources render them virtually nonavailable as homogeneous starting materials for a clinical program. Thus, the incorporation of these naturally occurring epitopes into carrier proteins or any favorable molecular context via conjugation for eliciting a therapeutically useful immunological response is inefficient at best, and often virtually impossible. Therefore, to effectively study these vaccines as therapeutic agents, sufficient material can only be obtained by chemical synthesis.

[0006] In an effort to remedy this problem, one of the continuing research efforts is the development of anti-cancer vaccines that incorporate fully synthetic carbohydrate moieties (For a review, see Danishefsky, S.J.; Allen, J.R. *Angew Chem. Int. Ed.* **2000**, *39*, 836-863). One strategy for the development of synthetic anti-cancer vaccines involves the total synthesis of the carbohydrate epitope and its subsequent covalent bioconjugation to carrier protein. The vaccine constructs are then subjected to appropriate mouse immunization studies, with the ultimate goal of advancing to human clinical trials. This strategy has resulted in several fully synthetic tumor associated carbohydrate-based vaccines which are at various stages of advanced pre-clinical and clinical processing. In fact, a Globo-H vaccine is undergoing clinical evaluation for the treatment of prostate and breast carcinomas at the phase II level (see, for example, Ragupathi *et al.*, *Angew. Chem. Int. Ed. Engl.* **1997**, *36*, 125) while a Lewis<sup>y</sup> antigen-based vaccine, already tested in ovarian cancer, is awaiting more extensive follow-up evaluation (see, Kudryashov *et al.* *Cancer Immunol. Immunother.* **1998**, *45*, 281).

[0007] Although several synthetic constructs have been developed in recent years, as described above, and in other references described herein, there remains a need for the further investigation to develop novel constructs capable of eliciting a more sustained or effective (and preferably selective) immune response. Clearly, in an effort to achieve this goal, it would be useful to develop improved and/or novel synthetic methods to access heretofore synthetically unavailable antigenic components (*e.g.*, more complex antigenic components such as fucosyl GM1, clustered epitopes and similar structures), or to access non-natural structures [derived from naturally occurring structures] for further immunologic and therapeutic studies.

### Summary of the Invention

[0008] In recognition of the need to further develop novel constructs and improved synthetic methods, the present invention, in one aspect, provides novel glycosides and glycoconjugates glycoamino acids, and methods for the synthesis and use thereof. In another aspect, the present invention provides novel clustered glycopeptides and methods for the synthesis and use thereof. In yet another aspect,

the present invention provides pharmaceutical compositions comprising novel glycosides and novel clustered glycopeptides. In still another aspect, the present invention provides methods for the treatment of cancer, preferably for the prevention of recurrence of cancer, and methods for inducing antibodies in a subject comprising administering to a subject in need, an effective amount of any of the inventive glycoconjugates as disclosed herein.

**[0009]** In one aspect of the present invention, novel n-alkenyl glycosides and n-alkenyl glycoconjugates glycoamino acids are provided. In certain exemplary embodiments, a synthetic methodology disclosed herein relies on the realization that the incorporation of an n-alkenyl glycoside protecting group at the reducing end of a carbohydrate acceptor allows for increased coupling efficiencies and accessibility to complex carbohydrates. Thus, the present invention also provides the recognition that for certain protected carbohydrates, the n-alkenyl moieties can serve as useful precursors that can be utilized ultimately for the synthesis of complex glycopeptides.

**[0010]** Thus, in one aspect, the present invention provides novel synthetic methodologies for the synthesis of complex carbohydrates comprising (1) providing a carbohydrate acceptor having a reducing end alkenyl group; (2) providing a suitable donor compound and (3) coupling said donor and acceptor under conditions to generate an alkenyl glycoside. Using this method, complex antigenic alkenyl glycosides are provided, as described above, many of which never before have been provided, which can then be conjugated or further reacted, as described herein, to generate glycoconjugates and glycopeptide structures.

**[0011]** Among other things, the present invention provides novel compounds and/or conjugates having the general structure:

wherein  $\text{L}^1$  is a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety;

R is hydrogen; substituted or unsubstituted alkyl; alkenyl; aryl;  $-\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ , wherein R' or R'' are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, aryl, peptide, protein or lipid;

$R'''$  or  $NHR'''$ , wherein  $R'''$  is an immunogenic carrier linked to  $L^1$  or  $N$  either directly or through a crosslinker;

A is a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a

substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $\text{COOH}$ ,  $\text{COOR}^{\text{ii}}$ ,  $\text{CONHR}^{\text{ii}}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{\text{iii}}$  is hydrogen,  $\text{CHO}$ ,  $\text{COOR}^{\text{iv}}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{\text{ii}}$  and  $R^{\text{iv}}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

**[0012]** In certain embodiments,  $L^1$  is  $-\text{O}-(\text{CH}_2)_n-$ , wherein  $n$  is 0-9, or a glycoside-containing moiety. In certain exemplary embodiments,  $L^1$  comprises a mono saccharide. In certain preferred embodiments,  $R$  is allyl,  $n$  is 2 and thus the inventive compounds comprise an  $n$ -pentenyl moiety. In certain other embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain other embodiments of the present invention,  $R$  is  $\text{NHR}^{\text{'''}}$ , and the carrier  $R^{\text{'''}}$  is KLH or Bovine Serum Albumin. In yet other embodiments, the immunogenic carrier is conjugated to the glycoside construct through one of its amino groups (*e.g.*, the carrier's amino groups). In still other embodiments of the present invention,  $R$  is  $\text{NHR}^{\text{'''}}$ , and the carrier  $R^{\text{'''}}$  is a lipid having the structure:

wherein  $m'$ ,  $n'$  and  $p'$  are each independently integers between about 8 and 20; and  $R_V$  is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl. In certain exemplary embodiments,  $m'$ ,  $n'$  and  $p'$  are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine (*e.g.*, PamCys). It will be appreciated that the protein or lipid can be linked to  $N$  or  $L^1$  either directly or through a crosslinker, and thus  $R^{\text{'''}}$  incorporates proteins, peptides, and lipids, as well as (crosslinker-protein), (crosslinker-peptide) and (crosslinker-lipid) moieties.

[0013] In other embodiments, the inventive compound is a glycoamino acid and thus R is  $\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ , which compound has the structure

wherein  $L^1$  is as defined above, and  $R'$  and  $R''$  are suitable protecting groups.

[0014] In certain preferred embodiments, the glycoamino acids of the present invention are derived from *n*-pentenyl glycosides and thus  $L^1$  is  $-\text{O}(\text{CH}_2)_3-$ . In certain other preferred embodiments,  $R'$  and  $R''$  are each a protecting group independently selected from the group consisting of benzyl, *t*-butyl, TSE (2-(trimethylsilyl) ethyl), Ac (acetyl), Boc (*t*-butoxycarbonyl), Cbz and Fmoc (9-fluorenyl methoxy carbonyl).

[0015] In certain embodiments,  $L^1$  is  $-\text{O}(\text{CH}_2)_n-$  and the present invention provides novel compounds and/or conjugates having the general structure:

wherein  $n$  is an integer from 0-9;

$R$  is hydrogen; substituted or unsubstituted alkyl; alkenyl; aryl;  $-\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ , wherein  $R'$  or  $R''$  are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, a linker, aryl, peptide, protein or lipid;  $R'''$  or  $\text{NHR}'''$ , wherein  $R'''$  is an immunogenic carrier, peptide, protein or lipid linked to N or the alkyl linker either directly or through a crosslinker;

$A$  is a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose

moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}, R_{11}, R_{12}, R_{13}, R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

[0016] In certain embodiments, if A is KH-1, N3, globo-H, glycophorin, Tn, TF, STN, (2,3)ST, 2,6-STn or Le<sup>y</sup>, and A is  $\alpha$ -O-linked, then n is at least 1. In certain other embodiments, A is  $\alpha$ - or  $\beta$ -O-linked.

[0017] In certain preferred embodiments of the present invention, R is allyl, n is 2 and thus the inventive compound is a n-pentenyl moiety. In certain other embodiments, the immunogenic carrier is protein, peptide, or lipid. In certain other embodiments of the present invention, R is NHR<sup>'''</sup>, and the carrier R<sup>'''</sup> is KLH or Bovine Serum Albumin. In yet other embodiments, the immunogenic carrier is conjugated to the glycoside construct through one of its amino groups (*e.g.*, the carrier's amino groups). In still other embodiments of the present invention, R is NHR<sup>'''</sup>, and the carrier R<sup>'''</sup> is a lipid having the structure:

wherein m', n' and p' are each independently integers between about 8 and 20; and R<sub>V</sub> is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl. In certain exemplary embodiments, m', n' and p' are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine (*e.g.*, PamCys). It will be appreciated that the protein or lipid can be linked to N or the rest of the construct either directly or through a crosslinker, and thus R<sup>'''</sup> incorporates proteins, peptides, and lipids, as well as (crosslinker-protein), (crosslinker-peptide) and (crosslinker-lipid) moieties.

[0018] In other embodiments, the inventive compound is a glycoamino acid and thus R is CH<sub>2</sub>CH(CO<sub>2</sub>R')(NHR<sup>'''</sup>), which compound has the structure:

[0019] In certain preferred embodiments, the glycoamino acids of the present invention are derived from n-pentenyl glycosides and thus n is 3. In certain other

preferred embodiments, R' and R'' are each a protecting group independently selected from the group consisting of benzyl, *t*-butyl, TSE (2-(trimethylsilyl ethyl), Ac (acetyl), Boc (*t*-butoxycarbonyl), Cbz and Fmoc (9-fluorenyl methoxy carbonyl).

[0020] For each of the compounds described above, in certain preferred embodiments the carbohydrate determinant is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, N3, Tn, TF, STN, (2,3)ST, 2,6-STn, Gb3 and Le<sup>y</sup>. In other preferred embodiments, the carbohydrate determinant of the compound contains a Globo-H determinant or fucosyl GM1 determinant, as all or part of the carbohydrate determinant A.

[0021] In another aspect, the present invention provides methods for the synthesis of novel *n*-alkyl glycoamino acids, as described in more detail below for Globo-H and fucosyl GM1 and their subsequent use to generate novel glycopeptides and synthetic constructs thereof.

[0022] In certain embodiments, the inventive method for the production of these novel glycoaminoacids comprises: 1) providing an alkenyl glycosidic moiety, as described herein; 2) subjecting said alkenyl glycosidic moiety to oxidative conditions to generate an aldehyde; 3) subjecting said aldehyde to olefination conditions to generate an enamide ester; 4) subjecting said resulting enamide ester to conditions sufficient to hydrogenate said enamide ester to generate a protected glycoamino acid and 5) deprotecting said protected glycoamino acid under suitable conditions to generate a desired glycoamino acid.

[0023] In particular, a method for the synthesis of a glycoamino acid, the structure of which is set forth herein, is provided, which comprises steps of:

(a) providing an alkenyl glycoside having the structure:

(b) reacting said alkenyl glycoside under suitable conditions to generate an enamide ester having the structure:

(c) reacting said enamide ester under suitable conditions to generate a glycoamino acid having the structure:

wherein, for each of the structures above,  $n$  is 0-8, wherein  $A$  is a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

and wherein for the glycoamino acid structure R' and R'' are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, linker, aryl, peptide, protein or lipid; R''' or NHR''', wherein R''' is an immunogenic carrier, linked to the glycoaminoacid moiety or N either directly or through a crosslinker. In preferred embodiments, R' and R'' are each independently hydrogen or a protecting group. In particularly preferred embodiments R'' is a nitrogen protecting group, including, but not limited to, acetyl, Fmoc, Cbz or Boc, and R' is an acid protecting group such as benzyl, *t*-butyl or TSE. In certain embodiments, the immunogenic carrier is a protein, peptide, or lipid. In certain preferred embodiments, the carbohydrate determinant is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST, Le<sup>y</sup>, N3, Tn, 2,6-STn, Gb3 and TF. In certain other preferred embodiments, the carbohydrate determinant of the compound contains a Globo-H determinant or a fucosyl GM1 determinant, as described herein, as all or part of the carbohydrate determinant A.

[0024] In certain preferred embodiments, the step of reacting an *n*-alkenyl glycoside under suitable conditions to generate an enamide ester comprises reacting an *n*-alkenyl glycoside first under oxidative conditions and second under olefination

conditions in the presence of base (*e.g.*, tetramethylguanidine) and phosphonate to generate an enamide ester.

[0025] In certain embodiments, the step of reacting said enamide ester under suitable conditions to generate a glycoamino acid comprises reacting said enamide ester under hydrogenation conditions.

[0026] In certain other embodiments, the inventive method for the production of these novel glycoaminoacids comprises: 1) providing an alkenyl glycosidic moiety, as described herein; 2) reacting said alkenyl glycosidic moiety with a suitable alkenylamino acid under suitable conditions in the presence of a suitable catalyst to generate an enamide ester; 4) subjecting said resulting enamide ester to conditions sufficient to hydrogenate said enamide ester to generate a protected glycoamino acid and 5) deprotecting said protected glycoamino acid under suitable conditions to generate a desired glycoamino acid. In certain embodiments, the alkenylamino acid is a suitably protected allylglycine.

[0027] For example, the present invention provides a method for the synthesis of a glycoamino acid, the structure of which is set forth herein, which method comprises steps of:

(a) providing an alkenyl glycoside having the structure:

(b) reacting said alkenyl glycosidic moiety with a suitable alkenylglycine under suitable conditions in the presence of a suitable catalyst to generate an enamide ester having the structure:

(c) reacting said enamide ester under suitable conditions to generate a glycoamino acid having the structure:

wherein, for each of the structures above,  $n$  is 0-8,  $q'$  is an integer from 0-8; wherein  $A$  is a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein  $Y$  and  $Z$  are independently NH or O; wherein  $k, l, r, s, t, u, v$  and  $w$  are each independently 0, 1 or 2; with the proviso that the  $v$  and  $w$  bracketed structures represent furanose or pyranose moieties and the sum of  $l$  and  $k$  is 1 or 2,

and the sum of  $s$  and  $u$  is 1 or 2, and with the proviso that  $v$  and  $w$  are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $COOH$ ,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen,  $CHO$ ,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

and wherein for the glycoamino acid structure  $R'$  and  $R''$  are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, linker, aryl, peptide, protein or lipid;  $R'''$  or  $NHR'''$ , wherein  $R'''$  is an immunogenic carrier, linked to N or the glycoamino acid moiety either directly or through a crosslinker. In certain preferred embodiments,  $R'$  and  $R''$  are each independently hydrogen or a protecting group. In particularly preferred embodiments  $R''$  is a nitrogen protecting group, including, but not limited to, acetyl, Fmoc, Cbz or Boc, and  $R'$  is an acid protecting group such as benzyl, *t*-butyl or TSE. In certain embodiments, the immunogenic carrier is a protein, peptide, or lipid. In certain preferred embodiments, the carbohydrate determinant is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST,  $Le^y$ , N3, Tn, 2,6-STn, Gb3 and TF. In certain other preferred embodiments, the carbohydrate determinant of the compound contains a Globo-H determinant or a fucosyl GM1 determinant, as described herein, as all or part of the carbohydrate determinant A.

[0028] In certain preferred embodiments, the step of reacting an *n*-alkenyl glycoside under suitable conditions to generate an enamide ester comprises reacting an *n*-alkenyl glycoside with a suitably protected alkenylglycine in the presence of a suitable catalyst. In certain exemplary embodiments, the protected alkenylglycine is a protected allylglycine having the structure:

[0029] In certain preferred embodiments, the protected allylglycine has the structure:

[0030] In certain other preferred embodiments, the catalyst is selected from the group consisting of:

wherein Cy represents a cyclohexyl moiety.

[0031] Additionally, in certain embodiments, the step of reacting said enamide ester under suitable conditions to generate a glycoamino acid comprises reacting said enamide ester under hydrogenation conditions.

[0032] In another aspect, the invention provides multi-antigenic glycopeptides comprising a peptidic backbone made up of two or more amino acids, wherein one or more of said amino acids is/are independently substituted with a glycosidic moiety having the structure:

wherein  $L^1$  is a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

**[0033]** In certain embodiments, if each occurrence of  $L^1$  is a moiety having the structure  $-O(CH_2)_n-$ , wherein each occurrence of  $n$  is independently 0-9, and if for each occurrence of  $n$ ,  $n = 0$ , then at least one occurrence of A has a different structure from other occurrences of A. In certain embodiments, the  $n$ -alkyl glycosidic moiety is either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. In certain embodiments, at least one occurrence of  $L^1$  is independently a glycoside-containing moiety. In certain exemplary embodiments, at least one occurrence of  $L^1$  independently comprises a monosaccharide. It will be appreciated that these inventive clustered glycopeptides are not limited to  $n$ -alkyl where  $n$  is greater than or equal to 1; rather multi-antigenic clustered glycopeptides can be linked via the traditional direct linkage ( $n=0$ ), via  $n$ -alkyl (such as pentyl) or via a glycoside moiety or any combination thereof. In other embodiments, each occurrence of A may be the same, however,  $n$ -alkenyl ( $n$  greater than 1) linkages or glycoside-containing linkages are then utilized. In preferred embodiments, each occurrence of A is independently selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST, Le<sup>y</sup>, N3, Tn, 2,6-STn, Gb3 and TF.

**[0034]** In certain embodiments, multi-antigenic glycopeptides are provided comprising a peptidic backbone made up of at least three glycoamino acids, wherein one or more of said amino acids is/are substituted with an  $n$ -alkyl glycosidic moiety having the structure:

wherein each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is

independently hydrogen, OH,  $\text{OR}^{\text{iii}}$ ,  $\text{NHR}^{\text{iii}}$ ,  $\text{NHCOR}^{\text{iii}}$ , F,  $\text{CH}_2\text{OH}$ ,  $\text{CH}_2\text{OR}^{\text{iii}}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $\text{R}_{16}$  is hydrogen,  $\text{COOH}$ ,  $\text{COOR}^{\text{ii}}$ ,  $\text{CONHR}^{\text{ii}}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $\text{R}^{\text{iii}}$  is hydrogen,  $\text{CHO}$ ,  $\text{COOR}^{\text{iv}}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $\text{R}^{\text{ii}}$  and  $\text{R}^{\text{iv}}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

wherein each occurrence of n is independently 0-8. In certain embodiments, if for each occurrence of n,  $n = 0$ , at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments, each occurrence of the n-alkyl glycosidic moiety is independently either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. It will be appreciated that these inventive clustered glycopeptides are not limited to n-alkyl where n is greater than or equal to 1; rather multi-antigenic clustered glycopeptides can be linked via the traditional direct linkage ( $n=0$ ) or via n-alkyl (such as pentyl) or any combination thereof. In other embodiments, each occurrence of A may be the same, however, n-alkenyl (n greater than 1) linkages are then utilized. In preferred embodiments, each occurrence of A is independently selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST,  $\text{Le}^x$ , N3, Tn, 2,6-STn, Gb3 and TF.

[0035] In certain embodiments, the inventive glycopeptide is a construct having the structure:

wherein q is 0 or 1;

m is an integer from 1-20;

R is hydrogen or an immunogenic carrier;

the linker is either a free carboxylic acid,  $-O-$ , (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated alkyl, aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein  $L^1$  is a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of  $A$  is independently a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen,  $OH$ ,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ ,  $F$ ,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or

tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO, COOR<sup>ii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'0 is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R10, R11, R12, R13, R14 and R15 is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH2OH, CH2OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R16 is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; and wherein each occurrence of n is independently 0-8; and wherein each glycosidic moiety is either  $\alpha$ - or  $\beta$ -linked to an amino acid. In certain embodiments, each occurrence of L<sup>1</sup> is independently a moiety having the structure -O(CH2)<sub>n</sub>- wherein n is an integer from 0-9. In certain embodiments, each occurrence of RA and RC is independently hydrogen or methyl. In certain embodiments, the glycopeptide is attached to a suitable immunogenic carrier via a linker and the glycopeptide has the structure:

[0036] In certain embodiments, multi-antigenic clusters having three or more antigens are desirable and thus the present invention also provides constructs having the following structure:

wherein  $q$  is 0 or 1;

$m$  is an integer from 1-19;

$R$  is hydrogen or an immunogenic carrier;

the linker is either a free carboxylic acid, -O-, (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester; wherein each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated moiety, or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$ ,  $R_E$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-

, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $\text{COOH}$ ,  $\text{COOR}^{\text{ii}}$ ,  $\text{CONHR}^{\text{ii}}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{\text{iii}}$  is hydrogen,  $\text{CHO}$ ,  $\text{COOR}^{\text{iv}}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{\text{ii}}$  and  $R^{\text{iv}}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

**[0037]** In certain embodiments, if each occurrence of  $L^1$  is a moiety having the structure  $-\text{O}(\text{CH}_2)_n-$ , wherein each occurrence of  $n$  is independently 0-9, and if for each occurrence of  $n$ ,  $n = 0$ , then at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments, each occurrence of the  $n$ -alkyl glycosidic moiety is independently either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. In certain embodiments, each occurrence of  $L^1$  is independently a moiety having the structure  $-\text{O}(\text{CH}_2)_n-$ , wherein each occurrence of  $n$  is independently 0-9. In certain embodiments, at least one occurrence of  $L^1$  is independently a glycoside-containing moiety. In certain exemplary embodiments, at least one occurrence of  $L^1$  independently comprises a monosaccharide. In certain embodiments, the immunogenic carrier is a protein, peptide or lipid. It will be appreciated that these inventive clustered glycopeptides are not limited to  $n$ -alkyl where  $n$  is greater than or equal to 1; rather multi-antigenic clustered glycopeptides can be linked via the traditional direct linkage ( $n=0$ ), via  $n$ -alkyl (such as pentyl) or via a glycoside moiety or any combination thereof. In other embodiments, each occurrence of A may be the same, however,  $n$ -alkenyl ( $n$  greater than 1) linkages or glycoside-containing linkages are then utilized. In preferred embodiments, each occurrence of A is independently selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST,  $\text{Le}^y$ , N3, Tn, 2,6-STn, Gb3 and TF. In certain other embodiments, each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen or methyl.

**[0038]** In certain embodiments, each occurrence of  $L^1$  is independently a moiety having the structure  $-\text{O}(\text{CH}_2)_n-$  and the multi-antigenic glycopeptide has the following structure:

wherein  $q$  is 0 or 1;

$m$  is an integer from 1-19;

$R$  is hydrogen or an immunogenic carrier;

the linker is either a free carboxylic acid, -O-, (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$ ,  $R_E$  and  $R_F$  is independently an alkyl glycosidic moiety having the structure:

wherein each occurrence of  $A$  is independently a carbohydrate domain having the structure:

wherein  $a$ ,  $b$ ,  $c$ ,  $d$ ,  $e$ ,  $f$ ,  $g$ ,  $h$ ,  $i$ ,  $x$ ,  $y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x$ ,  $y$  and  $z$  bracketed structures represent furanose or pyranose

moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}, R_{11}, R_{12}, R_{13}, R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; and wherein each occurrence of n is independently 0-9. In certain embodiments, if for each occurrence of n,  $n = 0$ , at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments,

each occurrence of the n-alkyl glycosidic moiety is independently either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. In certain embodiments, each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen or methyl. In yet other embodiments, the immunogenic carrier is a protein, peptide or lipid.

[0039] In certain embodiments, the glycopeptide is attached to a suitable immunogenic carrier via a linker and the glycopeptide has the structure:

[0040] In preferred embodiments, each occurrence of A is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST,  $\text{Le}^y$ , N3, Tn, 2,6 STn, Gb3 and TF. In but one preferred example, the present invention provides a novel trimeric antigenic glycopeptide incorporating globo-H,  $\text{Le}^y$  and Tn, to generate a novel trimeric antigenic compound. In certain other exemplary embodiments, the present invention provides a novel trimeric antigenic glycopeptide incorporating TF,  $\text{Le}^y$  and Tn, to generate a novel trimeric antigenic compound. In yet other exemplary embodiments, the present invention provides a novel pentameric antigenic glycopeptide incorporating Globo-H, STn, TF,  $\text{Le}^y$  and Tn, to generate a novel pentameric antigenic compound.

[0041] As detailed herein, in another aspect of the present invention, any of the inventive compounds may be conjugated to generate a glycoconjugate, and may be administered alone, with an immunogenic carrier (for example, a carrier protein, peptide or lipid), or with an immunological adjuvant or any combination thereof for the treatment of cancer and/or for preventing the recurrence of cancer, or may be administered alone or with an immunological adjuvant to induce antibodies in a subject. In certain exemplary embodiments, when the glycopeptide is a multi-antigenic glycopeptide (*e.g.*, one that comprises at least two different antigenic carbohydrate antigens on the peptide backbone), the antibodies induced recognize the carbohydrate antigens present on the peptidic backbone. In certain embodiments, the carbohydrate antigens present on the peptidic backbone comprise

a carbohydrate domain, or truncated or elongated version thereof, that is present on tumor cells.

### Definitions

[0042] Certain compounds of the present invention, and definitions of specific functional groups are also described in more detail below. For purposes of this invention, the chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 75<sup>th</sup> Ed., inside cover, and specific functional groups are defined as described therein. Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are described in "Organic Chemistry", Thomas Sorrell, University Science Books, Sausalito: 1999, the entire contents of which are incorporated herein by reference.

[0043] It will be appreciated that the compounds, as described herein, may be substituted with any number of substituents or functional moieties. In general, the term "substituted" whether preceded by the term "optionally" or not, and substituents contained in formulas of this invention, refer to the replacement of hydrogen radicals in a given structure with the radical of a specified substituent. When more than one position in any given structure may be substituted with more than one substituent selected from a specified group, the substituent may be either the same or different at every position unless otherwise indicated. As used herein, the term "substituted" is contemplated to include all permissible substituents of organic compounds. In a broad aspect, the permissible substituents include acyclic and cyclic, branched and unbranched, carbocyclic and heterocyclic, aromatic and nonaromatic substituents of organic compounds. For purposes of this invention, heteroatoms such as nitrogen may have hydrogen substituents and/or any permissible substituents of organic compounds described herein which satisfy the valencies of the heteroatoms. Furthermore, this invention is not intended to be limited in any manner by the permissible substituents of organic compounds. Combinations of substituents and variables envisioned by this invention are preferably those that result in the formation of stable compounds useful in the treatment of cancer, or in the inducement of antibodies, as described herein. The term "stable", as used herein, preferably refers to compounds which possess stability

sufficient to allow manufacture and which maintain the integrity of the compound for a sufficient period of time to be useful for the purposes detailed herein.

[0044] The term "aliphatic", as used herein, includes both saturated and unsaturated, straight chain (*i.e.*, unbranched), branched, cyclic, or polycyclic aliphatic hydrocarbons, which are optionally substituted with one or more functional groups. As will be appreciated by one of ordinary skill in the art, "aliphatic" is intended herein to include, but is not limited to, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, and cycloalkynyl moieties. Thus, as used herein, the term "alkyl" includes both straight, branched and cyclic alkyl groups. An analogous convention applies to other generic terms such as "alkenyl", "alkynyl" and the like. Furthermore, as used herein, the terms "alkyl", "alkenyl", "alkynyl" and the like encompass both substituted and unsubstituted groups.

[0045] The term "alkylamino" refers to a group having the structure -NHR' wherein R' is alkyl, as defined herein. Examples of alkylamino include, but are not limited to, methylamino, ethylamino, iso-propylamino and the like.

[0046] Some examples of substituents of the above-described aliphatic (and other) moieties of compounds of the invention include, but are not limited to: F, Cl, Br, I, OH, NO<sub>2</sub>, CN, C(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, C(O)-aryl, C(O)-heteroaryl, CO<sub>2</sub>-alkyl, CO<sub>2</sub>-aryl, CO<sub>2</sub>-heteroaryl, CONH<sub>2</sub>, CONH-C<sub>1</sub>-C<sub>6</sub>-alkyl, CONH-aryl, CONH-heteroaryl, OC(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, OC(O)-aryl, OC(O)-heteroaryl, OCO<sub>2</sub>-alkyl, OCO<sub>2</sub>-aryl, OCO<sub>2</sub>-heteroaryl, OCONH<sub>2</sub>, OCONH-C<sub>1</sub>-C<sub>6</sub>-alkyl, OCONH-aryl, OCONH-heteroaryl, NHC(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, NHC(O)-aryl, NHC(O)-heteroaryl, NHCO<sub>2</sub>-alkyl, NHCO<sub>2</sub>-aryl, NHCONH-heteroaryl, SO<sub>2</sub>-C<sub>1</sub>-C<sub>6</sub>-alkyl, SO<sub>2</sub>-aryl, C<sub>3</sub>-C<sub>6</sub>-cycloalkyl, CF<sub>3</sub>, CH<sub>2</sub>CF<sub>3</sub>, CHCl<sub>2</sub>, CH<sub>2</sub>OH, CH<sub>2</sub>CH<sub>2</sub>OH, CH<sub>2</sub>NH<sub>2</sub>, CH<sub>2</sub>SO<sub>2</sub>CH<sub>3</sub>, aryl, heteroaryl, benzyl, benzyloxy, aryloxy, heteroaryloxy, C<sub>1</sub>-C<sub>6</sub>-alkoxy, methoxymethoxy, methoxyethoxy, amino, benzylamino, arylamino, heteroarylamino, C<sub>1</sub>-C<sub>3</sub>-alkyl-amino, thio, aryl-thio, heteroarylthio, benzyl-thio, C<sub>1</sub>-C<sub>6</sub>-alkyl-thio, or methylthiomethyl. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples which are described herein.

[0047] In general, the terms "aryl" and "heteroaryl", as used herein, refer to stable mono- or polycyclic, heterocyclic, polycyclic, and polyheterocyclic

unsaturated moieties having preferably 3-14 carbon atoms, each of which may be substituted or unsubstituted. Substituents include, but are not limited to, any of the previously mentioned substitutents, *i.e.*, the substituents recited for aliphatic moieties, or for other moieties as disclosed herein, resulting in the formation of a stable compound. In certain embodiments of the present invention, "aryl" refers to a mono- or bicyclic carbocyclic ring system having one or two aromatic rings including, but not limited to, phenyl, naphthyl, tetrahydronaphthyl, indanyl, indenyl and the like. In certain embodiments of the present invention, the term "heteroaryl", as used herein, refers to a cyclic aromatic radical having from five to ten ring atoms of which one ring atom is selected from S, O and N; zero, one or two ring atoms are additional heteroatoms independently selected from S, O and N; and the remaining ring atoms are carbon, the radical being joined to the rest of the molecule via any of the ring atoms, such as, for example, pyridyl, pyrazinyl, pyrimidinyl, pyrrolyl, pyrazolyl, imidazolyl, thiazolyl, oxazolyl, isooxazolyl, thiadiazolyl, oxadiazolyl, thiophenyl, furanyl, quinolinyl, isoquinolinyl, and the like.

[0048] It will be appreciated that aryl and heteroaryl groups (including bicyclic aryl groups) can be unsubstituted or substituted, wherein substitution includes replacement of one, two or three of the hydrogen atoms thereon independently with any one or more of the following moieties including, but not limited to: F, Cl, Br, I, OH, NO<sub>2</sub>, CN, C(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, C(O)-aryl, C(O)-heteroaryl, CO<sub>2</sub>-alkyl, CO<sub>2</sub>-aryl, CO<sub>2</sub>-heteroaryl, CONH<sub>2</sub>, CONH-C<sub>1</sub>-C<sub>6</sub>-alkyl, CONH-aryl, CONH-heteroaryl, OC(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, OC(O)-aryl, OC(O)-heteroaryl, OCO<sub>2</sub>-alkyl, OCO<sub>2</sub>-aryl, OCO<sub>2</sub>-heteroaryl, OCONH<sub>2</sub>, OCONH-C<sub>1</sub>-C<sub>6</sub>-alkyl, OCONH-aryl, OCONH-heteroaryl, NHC(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, NHC(O)-aryl, NHC(O)-heteroaryl, NHCO<sub>2</sub>-alkyl, NHCO<sub>2</sub>-aryl, NHCONH-heteroaryl, SO<sub>2</sub>-C<sub>1</sub>-C<sub>6</sub>-alkyl, SO<sub>2</sub>-aryl, C<sub>3</sub>-C<sub>6</sub>-cycloalkyl, CF<sub>3</sub>, CH<sub>2</sub>CF<sub>3</sub>, CHCl<sub>2</sub>, CH<sub>2</sub>OH, CH<sub>2</sub>CH<sub>2</sub>OH, CH<sub>2</sub>NH<sub>2</sub>, CH<sub>2</sub>SO<sub>2</sub>CH<sub>3</sub>, aryl, heteroaryl, benzyl, benzyloxy, aryloxy, heteroaryloxy, C<sub>1</sub>-C<sub>6</sub>-alkoxy, methoxymethoxy, methoxyethoxy, amino, benzylamino, arylamino, heteroarylamino, C<sub>1</sub>-C<sub>3</sub>-alkyl-amino, thio, aryl-thio, heteroarylthio, benzyl-thio, C<sub>1</sub>-C<sub>6</sub>-alkyl-thio, or methylthiomethyl. Additional examples of generally applicable substitutents are illustrated by the specific embodiments shown in the Examples which are described herein.

[0049] The term "cycloalkyl", as used herein, refers specifically to groups having three to seven, preferably three to ten carbon atoms. Suitable cycloalkyls include, but are not limited to cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and the like, which, as in the case of other aliphatic, heteroaliphatic or heterocyclic moieties, may optionally be substituted. F, Cl, Br, I, OH, NO<sub>2</sub>, CN, C(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, C(O)-aryl, C(O)-heteroaryl, CO<sub>2</sub>-alkyl, CO<sub>2</sub>-aryl, CO<sub>2</sub>-heteroaryl, CONH<sub>2</sub>, CONH-C<sub>1</sub>-C<sub>6</sub>-alkyl, CONH-aryl, CONH-heteroaryl, OC(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, OC(O)-aryl, OC(O)-heteroaryl, OCO<sub>2</sub>-alkyl, OCO<sub>2</sub>-aryl, OCO<sub>2</sub>-heteroaryl, OCONH<sub>2</sub>, OCONH-C<sub>1</sub>-C<sub>6</sub>-alkyl, OCONH-aryl, OCONH-heteroaryl, NHC(O)-C<sub>1</sub>-C<sub>6</sub>-alkyl, NHC(O)-aryl, NHC(O)-heteroaryl, NHCO<sub>2</sub>-alkyl, NHCO<sub>2</sub>-aryl, NHCONH-heteroaryl, SO<sub>2</sub>-C<sub>1</sub>-C<sub>6</sub>-alkyl, SO<sub>2</sub>-aryl, C<sub>3</sub>-C<sub>6</sub>-cycloalkyl, CF<sub>3</sub>, CH<sub>2</sub>CF<sub>3</sub>, CHCl<sub>2</sub>, CH<sub>2</sub>OH, CH<sub>2</sub>CH<sub>2</sub>OH, CH<sub>2</sub>NH<sub>2</sub>, CH<sub>2</sub>SO<sub>2</sub>CH<sub>3</sub>, aryl, heteroaryl, benzyl, benzyloxy, aryloxy, heteroaryloxy, C<sub>1</sub>-C<sub>6</sub>-alkoxy, methoxymethoxy, methoxyethoxy, amino, benzylamino, arylamino, heteroaryl amino, C<sub>1</sub>-C<sub>3</sub>-alkyl-amino, thio, aryl-thio, heteroarylthio, benzyl-thio, C<sub>1</sub>-C<sub>6</sub>-alkyl-thio, or methylthiomethyl. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples which are described herein.

[0050] The terms "halo" and "halogen" as used herein refer to an atom selected from fluorine, chlorine, bromine and iodine.

[0051] It will be appreciated that additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples which are described herein, but are not limited to these Examples.

### Description of the Drawing

#### **Detailed Description of certain preferred embodiments of the Invention**

[0077] As discussed above, the desire to develop improved methods for the preparation of synthetic vaccines has led to increased research efforts directed toward the synthesis of naturally occurring complex carbohydrate antigens, as well as novel complex structures (*e.g.*, glycopeptides) incorporating these antigenic structures. As is often the case during the course of any such large synthetic undertaking, improved synthetic methods are often developed that can be applied universally. In particular, synthetic studies of naturally occurring antigenic structures has led to the development of novel methodologies enabling the development of heretofore unavailable synthetic carbohydrate-based vaccines. For a

review, *see* Danishefsky, S.J.; Allen, J.R., *Angew. Chem. Int. Ed. Engl.* **2000**, *39*, 836-863, and references cited therein.

[0078] Significantly, the present invention provides improved methodologies for the synthesis of complex carbohydrates and related therapeutic compounds (*e.g.*, glycoconjugates and/or glycopeptides). In particular, in the context of synthetic studies developed for the total syntheses of fucosyl GM1 and the n-pentenyl glycoside of Globo-H, generalized methodologies were developed for the improved synthesis of complex carbohydrate structures. This general synthetic method encompasses the realization that the incorporation of an n-alkenyl glycoside protecting group at the reducing end of a carbohydrate acceptor allows for increased coupling efficiencies and accessibility to complex carbohydrates. In yet another aspect, the present invention also provides the recognition that for certain protected carbohydrates, the n-alkenyl moieties can serve as useful precursors that can be utilized ultimately for the synthesis of complex glycopeptides.

[0079] Furthermore, the present invention also provides the recognition that the presence of the n-alkenyl moiety, whether or not in the context of an antigenic n-pentenyl glycoside or glycopeptide, is advantageous for the development of improved carbohydrate based therapeutics (*e.g.*, synthetic vaccines) because more efficient syntheses of conjugation precursors can be prepared (and ultimately conjugated), and the n-alkenyl carbohydrate also serves as a precursor for the synthesis of novel n-alkyl glycoamino acids, as described herein. The ability to easily access these glycoamino acids allows for the ultimate synthesis of complex clustered glycopeptides. Significantly, the methodologies provided by the present invention, as described above and in more detail herein, allow the efficient preparation of complex glycopeptide structures having *more than one type* of carbohydrate determinant.

[0080] Specific examples, particularly with respect to the total synthesis of fucosyl GM1 and a novel synthetic scheme for the synthesis of the n-pentenyl glycoside of Globo-H are described in more detail below, along with certain general methodologies developed during the course of these syntheses. It will be appreciated by one of ordinary skill in the art that these examples are not intended to

be limiting; rather all equivalents are intended to be incorporated into the scope of the present invention.

**[0081]** *Inventive Compounds and Methods for the Synthesis Thereof*

**[0082]** As mentioned above, the total synthesis of complex antigenic structures has led to significant development in methodologies for complex carbohydrate synthesis. Of particular recent interest is the naturally occurring antigenic structure, fucosylated GM1 ganglioside as shown in Figure 1 (**1a**) which heretofore had not yet been synthesized. Nilsson *et al.* identified fucosyl GM1 as a specific marker associated with small lung cancer (SCLC) cells (Nilsson *et al.*, *Glycoconjugate J.* **1984**, *1*, 43; Brezicka *et al.*, *Cancer Res.* **1989**, *49*, 1300). These workers isolated the glycosphingolipid fucosyl GM1 (**1a**) as the major ganglioside component contained in human SCLC tissue. Furthermore, monoclonal antibodies (F12) to the antigen serve to detect fucosyl GM1 in tissues and serum of SCLC patients (Nilsson *et al.*, *Cancer Res.* **1986**, *46*, 1403; Vangsted *et al.*, *Cancer Res.* **1991**, *51*, 2897). Immunohistochemistry studies have suggested that, due to its highly restricted distribution in normal tissues, fucosyl GM1 could be an excellent target for immune attack against SCLC. Remarkably, fucosyl GM1 has thus far not been found on any other human cancer cell lines, indicating that it is very SCLC tumor specific (Zhang *et al.*, *Int. J. Cancer* **1997**, *73*, 42).

**[0083]** The structural assignment of the carbohydrate moiety of the SCLC antigen was based on a combination of enzymatic and chemical degradations (Nilsson *et al.*, *Glycoconjugate J.* **1984**, *1*, 43). While there was no particular reason to question this assignment, the development of a carbohydrate based attack on SCLC could benefit from a definitive assignment of the linkage modes of the various monosaccharides, including the stereochemistry at each glycosidic attachment. Furthermore, no syntheses of this carbohydrate sector have appeared in the literature. In a preferred embodiment, a synthetic scheme would allow for presentation of the hexasaccharide epitope independent of the ceramide to the F12 mAb to ensure that all specificity is directed at the carbohydrate sector. In other preferred embodiments, the construct should be so functionalized as to anticipate the need for its conjugation to a carrier protein in anticipation of building an effective

anti-tumor vaccine. As detailed herein, the ability to generate an n-alkenyl glycoside enables for the efficient synthesis of this epitope and allows for its effective modification and/or conjugation to build an effective anti-tumor vaccine.

**[0084]** Thus, in one aspect of the present invention, the synthesis of the complex fucosyl GM1 carbohydrate sector has been achieved and a compound having the structure as shown below is provided:

wherein each occurrence of R' is independently hydrogen or a protecting group; wherein each occurrence of R'' is independently hydrogen or a nitrogen protecting group; wherein R is hydrogen, substituted or unsubstituted alkyl, alkenyl, -NHR''', wherein R''' is a protein, peptide or lipid linked to N or the rest of the construct either directly or through a crosslinker, an amino acyl moiety, an amino acyl residue of a peptide, an amino acyl residue of a protein, which amino acyl moiety or residue, or -NHR''' is linked to O via a polymethylene chain having the structure  $-(CH_2)_r$ , where r is an integer between 1 and 9, or wherein R is substituted with a moiety having the structure:

(c) reacting said thioethyl donor and said trisaccharide acceptor under conditions to generate a protected hexasaccharide and subsequently deprotecting the protected hexasaccharide under suitable conditions to generate n-alkenyl fucosyl GM1 glycoside.

[0087] In yet another aspect of the present invention, novel derivatives of Globo-H are provided and a novel general synthetic methodology for the synthesis thereof. The derivatives of Globo-H are depicted below:

wherein each occurrence of R' is hydrogen or a protecting group, wherein R'' is hydrogen or a nitrogen protecting group; wherein R is hydrogen, substituted or unsubstituted alkyl or alkenyl, wherein the alkenyl moiety has four or more carbons; -NHR''', wherein R''' is a protein, peptide or lipid linked to N or the rest of the construct either directly or through a crosslinker; an amino acyl moiety; an amino acyl residue of a peptide; an amino acyl residue of a protein; which amino acyl moiety or residue or -NHR''' is linked to O via a polymethylene chain having the structure  $-(CH_2)_r$ , where, if said carbohydrate moiety is linked to O via an  $\alpha$ -linkage, r is an integer between 2 and 9, or, alternatively, if said carbohydrate moiety is linked to O via a  $\beta$ -linkage, r is an integer between 1 and 9; or wherein R is substituted with a moiety having the structure:

[0088] In certain preferred embodiments, each occurrence of R' is hydrogen. In certain other preferred embodiments of the present invention, R is n-alkenyl, including, but not limited to allyl, propenyl, butenyl and pentenyl. In a particularly preferred embodiment, R is n-pentenyl. In certain other preferred embodiments, R is

an amino acyl moiety, an amino acyl residue of a peptide, or an amino acyl residue of a protein, as described above, wherein  $r$  is preferably 4. In still other preferred embodiments, a compound as described above is provided, with the proviso that the compound is not the glycosphingolipid structure.

[0089] As described in more detail herein in Example 2, a similar methodology to that described for fucosyl GM1 is employed for the synthesis of Globo-H and derivatives thereof. Thus, in another aspect of the present invention, a method for the improved synthesis of Globo-H, and derivatives thereof, said method comprising steps of:

(a) providing a thioethyl donor having the structure:

wherein P is a protecting group; and

(b) providing a trisaccharide acceptor having the structure:

wherein  $n$  is 0-8, and wherein P is a suitable protecting group; and

(c) reacting said thioethyl donor and said trisaccharide acceptor under conditions to generate a protected hexasaccharide and subsequently deprotecting the protected hexasaccharide under suitable conditions to generate  $n$ -alkenyl Globo-H.

In yet another aspect of the present invention, novel derivatives of Gb3 are provided and a novel general synthetic methodology for the synthesis thereof is described herein. Gb3 is a glycosphingolipid which is structurally related to Globo-H, in that, the trisaccharide portion of Gb3 is identical to the trisaccharide portion at the reducing end of Globo-H. Gb3 has recently been shown to be over expressed in Burkitt lymphoma cell-lines, human ovarian cancer, human teratocarcinoma, human embryonal carcinoma, and other types of tumor cells (See Hashimoto, S.; Sakamoto, H.; Honda, T.; Abe, H.; Nakamura, S.; Ikegami, S. *Tetrahedron Lett.* **1997**, *38*, 8969-8972, and references cited therein). Consequently, Gb3 emerged as an ideal target from the point of view of preparing novel vaccine constructs.

[0090] Derivatives of Gb3 provided in the present invention are depicted below:

wherein each occurrence of R' is hydrogen or a protecting group; wherein R is hydrogen, substituted or unsubstituted alkyl or alkenyl; a glycoside-containing moiety; a glycoside-linker moiety; R''', -NHR'''; -(glycoside-linker)-R'''; wherein R''' is an immunogenic carrier linked to the rest of the construct either directly or through a crosslinker; an amino acyl moiety; an amino acyl residue of a peptide; an amino acyl residue of a protein; which amino acyl moiety or residue or -NHR''' is linked to O via a polymethylene chain having the structure  $-(CH_2)_r$ , where, if said carbohydrate moiety is linked to O via an  $\alpha$ -linkage, r is an integer between 2 and 9,

or, alternatively, if said carbohydrate moiety is linked to O via a  $\beta$ -linkage, r is an integer between 1 and 9; or wherein R is a moiety having the structure:

[0091] In certain preferred embodiments, each occurrence of R' is hydrogen. In certain other preferred embodiments of the present invention, R is n-alkenyl, including, but not limited to allyl, propenyl, butenyl and pentenyl. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In a particularly preferred embodiment, R is n-pentenyl. In certain other preferred embodiments, R is an amino acyl moiety, an amino acyl residue of a peptide, or an amino acyl residue of a protein, as described above, wherein r is preferably 4. In certain preferred embodiments, R is a glycoside. In particularly preferred embodiments, R is a monosaccharide. In still other preferred embodiments, a compound as described above is provided, with the proviso that the compound is not the glycosphingolipid structure.

[0092] In another aspect, the invention provides Gb3 n-alkenyl, glycoamino acid, derivatives and conjugates thereof.

[0093] In another aspect of the present invention, a method for the synthesis of Gb3, and derivatives thereof is provided, said method comprising steps of:

(a) providing a fluoromonosaccharide donor having the structure:

wherein each occurrence of P is independently a suitable protecting group;

and

(b) providing a disaccharide acceptor having the structure:

wherein each occurrence of P is independently a suitable protecting group;

(c) reacting said fluoromonosaccharide donor and said disaccharide acceptor under conditions to generate a protected trisaccharide having the structure:

(d) reacting said protected trisaccharide with an alkenol under suitable conditions and subsequently deprotecting the protected hexasaccharide under suitable conditions to generate n-alkenyl Gb3.

[0094] In another aspect of the present invention, a method for the synthesis of a Gb3 glycoamino acid, and derivatives thereof is provided, said method comprising steps of:

(a) providing an alkenyl trisaccharide having the structure:

wherein each occurrence of P is independently a suitable protecting group;  
and n is 1-8;

(b) providing a suitably protected alkenylglycine having the structure:

wherein R' and R'' are suitable protecting groups; and q' is 0-8;

(c) reacting said alkenyl trisaccharide and said alkenylglycine under suitable conditions in the presence of a suitable catalyst to generate an enamide ester having the structure:

(c) reacting said enamide ester under suitable conditions to generate a glycoamino acid having the structure:

wherein, for each of the structures above,  $n$  is 0-8,  $q'$  is an integer from 0-8, and each occurrence of  $P$ ,  $R'$  and  $R''$  is independently a suitable protecting group.

It will be appreciated that for each of the methods as detailed herein, the full arsenal of protecting groups known in the art of organic synthesis can be utilized, for example, as set forth in "Activating Agents and Protecting Groups: Handbook of Reagents for Organic Synthesis" Roush, W.R. and Pearson, A.J., Eds., John Wiley & Sons: 1999; and "Protective Groups in Organic Synthesis" Greene, T.W. and Wuts, P.G., John Wiley & Sons, New York: 1999, the entire contents of which are hereby incorporated by reference. In but a few examples, suitable protecting groups utilized herein include, but are not limited to, Bn (benzyl), TIPS (triisopropylsilyl), and Ac (acetate). In a preferred embodiment of the present invention, said thioethyl donor and said trisaccharide acceptor are reacted under MeOTf promotion, as described herein. It will be appreciated by one of ordinary skill in the art however,

that a variety of conditions known in the art of organic synthesis can be utilized to effect coupling of these moieties.

[0095] It will also be appreciated that the novel n-alkenyl moieties provided herein can be subsequently modified to generate useful compounds (*e.g.*, alkyl derivatives and glycoamino acids) or constructs thereof (*e.g.*, glycopeptides and conjugated derivatives).

[0096] In addition to providing the first synthesis of fucosyl GM1, a synthesis of Gb3 and improved synthetic methodologies for Globo-H, as described above, in a more general aspect, the present invention provides novel synthetic methodologies for the synthesis of complex carbohydrates comprising (1) providing a carbohydrate acceptor having a reducing end alkenyl group; (2) providing a suitable donor compound and (3) coupling said donor and acceptor under conditions to generate an alkenyl glycoside. Using this method, complex antigenic alkenyl glycosides are provided, as described above, many of which never before have been provided, which can then be conjugated or further reacted, as described herein, to generate glycoconjugates and glycopeptide structures.

[0097] Thus, in one aspect, the present invention provides novel compounds and/or conjugates having the general structure:

wherein  $\text{L}^1$  is a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety;

R is hydrogen; substituted or unsubstituted alkyl; alkenyl; aryl;  $-\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ , wherein R' or R'' are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, a linker, aryl, peptide, protein or lipid;  $\text{R}'''$  or  $\text{NHR}'''$ , wherein R''' is an immunogenic carrier, peptide, protein or lipid linked to N or the rest of the construct either directly or through a crosslinker;

A is a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or

unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

[0098] In certain embodiments, if each occurrence of L<sup>1</sup> is a moiety having the structure -O(CH<sub>2</sub>)<sub>n</sub>- and if for each occurrence of n, n = 0, then at least one occurrence of A has a different structure from other occurrences of A. In certain embodiments, each occurrence of L<sup>1</sup> is independently -O-(CH<sub>2</sub>)<sub>n</sub>-, wherein n is 0-9, or a glycoside-containing moiety (e.g., mono saccharide). In certain preferred embodiments, R is allyl, n is 2 and thus the inventive compounds comprise an n-pentenyl moiety. In certain other embodiments, the immunogenic carrier is a protein, peptide, or lipid. In certain other embodiments of the present invention, R is NHR<sup>'''</sup>, and the carrier R<sup>'''</sup> is KLH or Bovine Serum Albumin. In still other embodiments of the present invention, R is NHR<sup>'''</sup>, and the carrier R<sup>'''</sup> is a lipid having the structure:

wherein  $m'$ ,  $n'$  and  $p'$  are each independently integers between about 8 and 20; and  $R_V$  is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl. In certain exemplary embodiments,  $m'$ ,  $n'$  and  $p'$  are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine (e.g., PamCys). It will be appreciated that the carrier can be linked to the rest of the construct directly or through a crosslinker, and thus  $R'''$  incorporates proteins, peptides, and lipids, as well as (crosslinker-protein), (crosslinker-peptide) and (crosslinker-lipid) moieties.

**[0100]** In other embodiments, the inventive compound is a glycoamino acid and thus R is  $\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ , which compound has the structure:

[0101] In certain preferred embodiments, the glycoamino acids of the present invention are derived from *n*-pentenyl glycosides and thus  $\text{L}^1$  is  $-\text{O}(\text{CH}_2)_3-$ . In certain other preferred embodiments,  $\text{R}'$  and  $\text{R}''$  are each a protecting group independently selected from the group consisting of benzyl, *t*-butyl, TSE (2-(trimethylsilyl ethyl), Ac (acetyl), Boc (*t*-butoxycarbonyl), Cbz and Fmoc (9-fluorenyl methoxy carbonyl).

[0102] In certain embodiments, the present invention provides novel compounds and/or conjugates having the general structure:

wherein  $\text{R}$  is hydrogen; substituted or unsubstituted alkyl; alkenyl; aryl;  $-\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ , wherein  $\text{R}'$  or  $\text{R}''$  are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, a linker, aryl, protein, peptide or lipid;  $\text{R}'''$  or  $\text{NHR}'''$ , wherein  $\text{R}'''$  is an immunogenic carrier, protein, peptide, or lipid, linked to  $\text{N}$  or the rest of the construct either directly or through a crosslinker; wherein  $n$  is 0-9; wherein  $\text{A}$  is a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $\text{R}_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $\text{R}_1, \text{R}_2, \text{R}_3, \text{R}_4, \text{R}_5, \text{R}_6, \text{R}_7, \text{R}_8$  and  $\text{R}_9$  is

independently hydrogen, OH, OR<sup>i</sup>, NHR<sup>i</sup>, NHCOR<sup>i</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>i</sup>, a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sup>i</sup> is independently hydrogen, CHO, COOR<sup>ii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'0 is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

**[0103]** In certain exemplary embodiments, if A is KH-1, N3, globo-H, glycophorin, Tn, TF, STN, (2,3-ST), 2,6-STn or Le<sup>y</sup>, and A is α-O-linked, then n is at least 1. In certain embodiments, A is α- or β-O-linked. In certain preferred embodiments of the present invention, R is allyl, n is 2 and thus the inventive compound is an n-pentenyl moiety. In certain embodiments, the immunogenic carrier is a protein, peptide, or lipid. In certain other embodiments of the present

invention, R is NHR<sup>'''</sup>, and the carrier R<sup>'''</sup> is KLH or Bovine Serum Albumin. In still other embodiments of the present invention, R is NHR<sup>'''</sup>, and the carrier R<sup>'''</sup> is a lipid having the structure:

wherein m', n' and p' are each independently integers between about 8 and 20; and R<sub>V</sub> is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl. In certain exemplary embodiments, m', n' and p' are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine (*e.g.*, PamCys). It will be appreciated that the protein or lipid can be linked to N or the rest of the construct either directly or through a crosslinker and thus R<sup>'''</sup> incorporates proteins, peptides and lipids, as well as (crosslinker-protein), (crosslinker-peptide) and (crosslinker-lipid) moieties. In certain preferred embodiments, the crosslinker is MMCCH (4-(maleimidomethyl) cyclohexane-1-carboxyl hydrazide).

[0104] In still other embodiments, the inventive compound is a glycoamino acid and thus R is CH<sub>2</sub>CH(CO<sub>2</sub>R')(NHR''), which compound has the structure:

[0105] In certain preferred embodiments, the glycoamino acids of the present invention are derived from n-pentenyl glycosides and thus n is 3. In certain other preferred embodiments, R' and R'' are a protecting group, each independently selected from the group consisting of benzyl, t-butyl, TSE, Boc, Fmoc, Cbz and acetyl.

[0106] For each of the compounds described above, in certain preferred embodiments the carbohydrate determinant is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, N3, glycophorin, Tn, TF, STN, (2,3)ST, 2,6-STn, Gb3 and Le<sup>y</sup>. In other preferred embodiments, the carbohydrate determinant of the

compound contains a Globo-H determinant or fucosyl GM1 determinant as all of part of the carbohydrate determinant A.

[0107] Crosslinkers suited to the invention are widely known in the art (see, for example, 1994 Pierce Technical Handbook: cross-linking available at <http://www.piercenet.com/resources/browse.cfm?fldID=184>), including bromoacetic NHS ester, 6-(iodoacetamido)caproic acid NHS ester, maleimidoacetic acid NHS ester, maleimidobenzoic acid NHS ester, etc. In certain preferred embodiments, the crosslinker is MMCCH (4-(maleimidomethyl) cyclohexane-1-carboxyl hydrazide). In certain other preferred embodiments, the crosslinker is MBS (m-maleimidobenzoyl acid N-Hydroxysuccinimidyl ester).

[0108] As described above, specifically in the context of the second generation synthesis of the MBr1 antigen (GloboH) and the total synthesis of the fucosylated ganglioside of GM1 (fucosyl GM1) and Gb3, incorporating the reducing end n-alkenyl moiety (specifically n-pentenyl) offers certain benefits. First, the anomeric n-pentenyl glycoside linkage serves as an effective linker for immunoconjugation to carrier protein KLH and also provides some advantages in terms of synthetic convergency. In the context of protected carbohydrates, the n-alkenyl moieties are also capable of acting as donors for glycosylation (see, for example, Fraser-Reid *et al.*, *SynLett*, **1992**, 927).

[0109] In this context, the present invention additionally provides methods for the synthesis of n-alkyl glycoamino acids, as described in more detail below for Globo-H and fucosyl GM1 and their subsequent use to generate glycopeptides and synthetic constructs thereof.

[0110] In certain embodiments, the inventive method for the production of these novel glycoaminoacids comprises: 1) providing an alkenyl glycosidic moiety, as described herein; 2) subjecting said alkenyl glycosidic moiety to oxidative conditions to generate an aldehyde; 3) subjecting said aldehyde to olefination conditions to generate an enamide ester; 4) subjecting said resulting enamide ester to conditions sufficient to hydrogenate said enamide ester to generate a protected glycoamino acid and 5) deprotecting said protected glycoamino acid under suitable conditions to generate a desired glycoamino acid.

[0111] In particular, a method for the synthesis of a glycoamino acid, the structure of which is set forth herein, is provided, which comprises steps of:

(a) providing an alkenyl glycoside having the structure:

(b) reacting said alkenyl glycoside under suitable conditions to generate an enamide ester having the structure:

(c) reacting said enamide ester under suitable conditions to generate a glycoamino acid having the structure:

wherein, for each of the structures above,  $n$  is 0-8, wherein  $A$  is a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or

unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

and wherein for the glycoamino acid structure R' and R'' are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, linker, aryl, peptide, protein or lipid; R''' or NHR''', wherein R''' is an immunogenic carrier, protein, peptide, or lipid, linked to N or the rest of the construct either directly or through a crosslinker. In preferred embodiments, R' and R'' are each independently hydrogen or a protecting group. In particularly preferred embodiments R'' is a nitrogen protecting group, including, but not limited to, acetyl, Fmoc, Cbz or Boc, and R' is an acid protecting group such as benzyl, *t*-butyl or TSE. It will be appreciated, however, that a variety of protecting groups known in the art of organic synthesis can be employed, as referenced herein.

[0112] In certain preferred embodiments, the carbohydrate determinant is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST, Le<sup>y</sup>, N3, Tn, 2,6-STn, Gb3 and TF. In certain other preferred embodiments, the carbohydrate determinant of the compound contains a Globo-H determinant or a fucosyl GM1 determinant, as described herein, as all or part of the carbohydrate determinant A.

[0113] In general, in preferred embodiments, the step of reacting an n-alkenyl glycoside under suitable conditions to generate an enamide ester comprises reacting an n-alkenyl glycoside first under oxidative conditions and second under olefination conditions in the presence of base (*e.g.*, tetramethylguanidine) and phosphonate to generate an enamide ester. It will be appreciated that other oxidative conditions known in the art of organic synthesis can be employed, including, but not limited to OsO<sub>4</sub> and periodate, or OsO<sub>4</sub> and Pb(OAc)<sub>4</sub>. Additionally, other well-known bases can be utilized in the present invention, including, but not limited to, lithium t-butoxide or lithium hexamethyl disilylazide.

[0114] In certain exemplary embodiments, reacting said enamide ester under suitable conditions to generate a glycoamino acid comprises reacting said enamide ester under hydrogenation conditions and subsequent reaction under deprotection conditions to generate a glycoamino acid. It is particularly preferred that the hydrogenation conditions employed are asymmetric hydrogenation conditions. In a preferred embodiment, asymmetric hydrogenation can be achieved by utilizing an ethyl DuPHOS catalyst precursor, as described in more detail herein (see, Burk *et al. Accts. Chem. Res.* **2000**, *33*, 3631; Burk *et al. Pure & Appl. Chem.* **1996**, *68*, 37).

[0115] In certain other embodiments, the inventive method for the production of these novel glycoaminoacids comprises: (i) providing a suitable alkenyl glycoside; (ii) providing a suitably protected alkenylamino acid; (iii) reacting the alkenyl glycoside with the alkenylamino acid under suitable conditions in the presence of a suitable catalyst to generate a glycoenamide ester; and (iv) subjecting the glycoenamide ester to suitable conditions to generate a glycoamino acid.

[0116] In preferred embodiments, the step of reacting an alkenyl glycoside under suitable conditions to generate an enamide ester comprises reacting an n-

alkenyl glycoside with a suitably protected alkenylamino acid under cross-metathesis conditions in the presence of a suitable catalyst. In certain exemplary embodiments, the protected alkenylamino acid is an allylglycine having the structure:

wherein R' and R'' are each independently hydrogen or a protecting group. In certain embodiments, the step of reacting said glycoenamide ester under suitable conditions to generate a glycoamino acid comprises reacting said enamide ester under hydrogenation conditions and subsequent reaction under deprotection conditions to generate a glycoamino acid. In certain exemplary embodiments, the method for the synthesis of a glycoamino acid comprises steps of:

(a) providing an alkenyl glycoside having the structure:

(b) reacting said alkenyl glycosidic moiety with a suitable alkenylglycine under suitable conditions in the presence of a suitable catalyst to generate an enamide ester having the structure:

(c) reacting said enamide ester under suitable conditions to generate a glycoamino acid having the structure:

wherein, for each of the structures above, n is 0-8;

q' is an integer from 0-8;

A is a carbohydrate domain having the structure:

wherein  $a$ ,  $b$ ,  $c$ ,  $d$ ,  $e$ ,  $f$ ,  $g$ ,  $h$ ,  $i$ ,  $x$ ,  $y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x$ ,  $y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x$ ,  $y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein  $Y$  and  $Z$  are independently NH or O; wherein  $k$ ,  $l$ ,  $r$ ,  $s$ ,  $t$ ,  $u$ ,  $v$  and  $w$  are each independently 0, 1 or 2; with the proviso that the  $v$  and  $w$  bracketed structures represent furanose or pyranose moieties and the sum of  $l$  and  $k$  is 1 or 2, and the sum of  $s$  and  $u$  is 1 or 2, and with the proviso that  $v$  and  $w$  are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or

unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

and wherein for the glycoamino acid structure  $R'$  and  $R''$  are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, linker, aryl, peptide, protein or lipid;  $R'''$  or  $NHR'''$ , wherein  $R'''$  is an immunogenic carrier, protein, peptide, or lipid, linked to the rest of the construct directly or through a crosslinker. In preferred embodiments,  $R'$  and  $R''$  are each independently hydrogen or a protecting group. In particularly preferred embodiments  $R''$  is a nitrogen protecting group, including, but not limited to, acetyl, Fmoc, Cbz or Boc, and  $R'$  is an acid protecting group such as benzyl, *t*-butyl or TSE. In certain preferred embodiments, the carbohydrate determinant is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST, Le<sup>y</sup>, N3, Tn, 2,6-STn, Gb3 and TF. In certain other preferred embodiments, the carbohydrate determinant of the compound contains a Globo-H determinant or a fucosyl GM1 determinant, as described herein, as all or part of the carbohydrate determinant A.

[0117] In certain preferred embodiments, the protected alkenylglycine has the structure:

[0118] In certain other embodiments, the catalyst is selected from the group consisting of:

wherein Cy represents a cyclohexyl moiety. (see, for example, Furstner, A. *Angew. Chem., Int. Ed. Engl.* **2000**, 39, 3013-3043).

[0119] In certain exemplary embodiments, the catalysts is bis(tricyclohexyl phosphine) ruthenium Grubbs catalyst:

[0120] Additionally, in certain embodiments, the step of subjecting the glycoenamide ester to suitable conditions to generate a glycoamino acid comprises catalytic hydrogenation. In certain exemplary embodiments, the hydrogenation reaction concomitantly removes the nitrogen protecting group on the amino acid moiety, thus generating a glycoamino acid unit suitable for incorporation into a peptide construct.

[0121] It will be appreciated that the ability to generate the glycoamino acids, as described herein, ultimately enables the synthesis of novel clustered glycopeptides, a motif commonly found on the surface of cancer cells (mucin-like structures) which are desirable for the uses described herein as anticancer vaccines. For example, immunological studies indicate that, in general, the clustering of antigens in glycopeptides results in a more therapeutically immune response than with singly glycosylated peptides (see, Lo-Man, R. *et al.*, *Cancer Res.*, **1999**, 59, 1520; Reddish *et al.*, *Glycoconjugate J.* **1997**, 14, 549).

[0122] To date, the clustering of  $\alpha$ -O-linked antigens has been accomplished with the same antigen across the peptide backbone via the traditional allyl linkage, as described in pending US patent numbers 09/083,776 and 09/276,595, the entire contents of which are hereby incorporated by reference. However, the present invention efficiently provides peptides having different antigens simultaneously in a clustered format. Thus, in one aspect, the present invention provides multi-antigenic glycopeptides comprising a peptidic backbone made up of two or more amino acids, wherein one or more of said amino acids is/are independently substituted with a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or

unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

**[0123]** In certain embodiments, if each occurrence of L<sup>1</sup> is a moiety having the structure -O(CH<sub>2</sub>)<sub>n</sub>- and if for each occurrence of n, n = 0, then at least one occurrence of A has a different structure from other occurrences of A. In certain embodiments, each occurrence of L<sup>1</sup> is independently -O-(CH<sub>2</sub>)<sub>n</sub>-, wherein n is 0-9, or a glycoside-containing moiety (e.g mono- or poly-saccharide).

**[0124]** It will also be appreciated from the structures as set forth above, that, in addition to providing multi-antigenic structures, the present invention additionally provides clustered structures having one or more saccharide linkages. Thus, in yet another aspect of the present invention, saccharide linked clustered glycopeptides

are provided, which glycopeptides may incorporate multiple antigenic structures or may also incorporate all of the same antigenic structures.

[0125] In certain embodiments, multi-antigenic glycopeptides are provided comprising a peptidic backbone made up of at least three glycoamino acids, wherein one or more of said amino acids is/are substituted with an n-alkyl glycosidic moiety having the structure:

wherein each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein R<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub> and R<sub>9</sub> is independently hydrogen, OH, OR<sup>i</sup>, NHR<sup>i</sup>, NHCOR<sup>i</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>i</sup>, a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sup>i</sup> is independently hydrogen, CHO, COOR<sup>ii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

wherein each occurrence of n is independently 0-8. In certain embodiments, if for each occurrence of n, n = 0, at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments, each occurrence of the n-alkyl glycosidic moiety is independently either α- or β-linked to an amino acid residue of the backbone. It will be appreciated that these inventive clustered glycopeptides are not limited to n-alkyl where n is greater than or equal to 1; rather multi-antigenic clustered glycopeptides can be linked via the traditional direct linkage (n=0) or via n-alkyl (such as pentyl) or any combination thereof. In preferred embodiments, each occurrence of A is independently selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST, Le<sup>y</sup>, N3, Tn, 2,6-STn, Gb3 and TF.

R is hydrogen or an immunogenic carrier;

the linker is either a free carboxylic acid,  $-O-$ , (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated alkyl, aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a

substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO, COOR<sup>ii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; and wherein each occurrence of n is independently 0-8; and wherein each glycosidic moiety is either  $\alpha$ - or  $\beta$ -linked to an amino acid. In certain embodiments, each occurrence of  $L^1$  is independently a moiety having the structure  $-O(CH_2)_n-$  wherein n is an integer from 0-9. In certain embodiments, each occurrence of  $R_A$  and  $R_C$  is independently hydrogen or methyl. In still other embodiments, the immunogenic carrier is a protein, peptide or lipid.

**[0130]** In certain embodiments, the glycopeptide is attached to a suitable immunogenic carrier via a linker and the glycopeptide has the structure:

[0131] In certain embodiments, for the above two constructs,  $m$  is at least 4. In certain other embodiments,  $m$  is at least 5. In yet other embodiments,  $m$  is at least 6.

[0132] While the glycopeptide of the present invention is not intended to be limited in size, in certain preferred embodiments, multi-antigenic clusters having three or more antigens are desirable and thus the present invention also provides constructs having the following structure:

wherein  $q$  is 0 or 1;

$m$  is an integer from 1-19;

$R$  is hydrogen or an immunogenic carrier;

the linker is either a free carboxylic acid, -O-, (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

wherein each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated alkyl, aliphatic or heteroaliphatic moiety or a substituted or

unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$ ,  $R_E$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of  $A$  is independently a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein  $Y$  and  $Z$  are independently NH or O; wherein  $k, l, r, s, t, u, v$  and  $w$  are each independently 0, 1 or 2; with the proviso that the  $v$  and  $w$  bracketed structures

represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $COOH$ ,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen,  $CHO$ ,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group.

[0133] In certain embodiments, if each occurrence of  $L^1$  is independently a moiety having the structure  $-O(CH_2)_n-$ , wherein each occurrence of n is independently 0-9, and if for each occurrence of n,  $n = 0$ , then at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments, the glycosidic moiety is either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. In certain embodiments, each occurrence of  $L^1$  is independently a moiety having the structure  $-O(CH_2)_n-$ , wherein each occurrence of n is independently 0-, or a glycoside-containing moiety. In certain exemplary embodiments, at one occurrence of  $L^1$  comprises a monosaccharide. It will be appreciated that these inventive clustered glycopeptides are not limited to n-alkyl where n is greater than or equal to 1; rather multi-antigenic clustered glycopeptides can be linked via the traditional direct linkage ( $n=0$ ), via n-alkyl (such as pentyl) or via a glycoside moiety or any combination thereof. In other embodiments, each occurrence of A may be the same, however, n-alkenyl (n greater than 1) linkages or glycoside-containing linkages are then utilized. In preferred embodiments, each occurrence of A is independently selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST,  $Le^y$ , N3, Tn, 2,6-STn, Gb3 and TF. In certain other embodiments, each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently

hydrogen or methyl. In still other embodiments, the immunogenic carrier is a protein, peptide or lipid.

[0134] In certain embodiments, each occurrence of  $L^1$  is independently a moiety having the structure  $-O(CH_2)_n-$  and the multi-antigenic glycopeptide has the following structure:

wherein  $q$  is 0 or 1;

$m$  is an integer from 1-19;

$R$  is hydrogen or an immunogenic carrier;

the linker is either a free carboxylic acid,  $-O-$ , (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$ ,  $R_E$  and  $R_F$  is independently an alkyl glycosidic moiety having the structure:

wherein each occurrence of  $A$  is independently a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $COOH$ ,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or

branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; and wherein each occurrence of n is independently 0-8. In certain embodiments, if for each occurrence of n,  $n = 0$ , at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments, each occurrence of the n-alkyl glycosidic moiety is independently either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. In certain embodiments, each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen or methyl. In still other embodiments, the immunogenic carrier is a protein, peptide or lipid.

**[0135]** In certain embodiments, the glycopeptide is attached to a suitable immunogenic carrier via a linker and the glycopeptide has the following structure:

wherein q is 0 or 1;

m is an integer from 1-19;

the linker is either a free carboxylic acid, -O-, (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

the carrier is an immunogenic carrier;

each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl

moiety; and wherein each occurrence of  $R_D$ ,  $R_E$  and  $R_F$  is independently an alkyl glycosidic moiety having the structure:

wherein each occurrence of A is independently a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures

represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $COOH$ ,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen,  $CHO$ ,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; and wherein each occurrence of n is independently 0-8. In certain embodiments, if for each occurrence of n,  $n = 0$ , at least one occurrence of A has a different structure from other occurrences of A. In certain other embodiments, each occurrence of the n-alkyl glycosidic moiety is independently either  $\alpha$ - or  $\beta$ -linked to an amino acid residue of the backbone. In certain embodiments, each occurrence of  $R_A$ ,  $R_B$  and  $R_C$  is independently hydrogen or methyl. In still other embodiments, the immunogenic carrier is a protein, peptide or lipid.

[0136] In certain embodiments, for the above three constructs, m is at least 3. In certain other embodiments, m is at least 4. In yet other embodiments, m is at least 5. In yet other embodiments, m is at least 6.

[0137] In certain embodiments, for the above five constructs, q is 1 and the crosslinker is a fragment having the structure:

whereby said structure is generated upon conjugation of a maleimidobenzoic acid N-hydroxy succinimide ester with a linker.

[0138] In certain embodiments, for the above five constructs, the linker is -O-,  $-NR_G$ -,  $-NR_G(\text{aliphatic})NR_J$ -,  $-NR_G(\text{heteroaliphatic})NR_J$ -,  $-(\text{aliphatic})NR_J$ -, -

(heteroaliphatic)NR<sub>J</sub>-, -O(aliphatic)NR<sub>J</sub>-, -O(heteroaliphatic)NR<sub>J</sub>-, -NR<sub>G</sub>(aliphatic)NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, -NR<sub>G</sub>(heteroaliphatic)NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, - (aliphatic)NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, -(heteroaliphatic)NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, -O(aliphatic)NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, -O(heteroaliphatic)NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of k is independently 1-5; wherein each occurrence of R<sub>G</sub>, R<sub>H</sub>, R<sub>I</sub> or R<sub>J</sub> is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety, and wherein each aliphatic or heteroaliphatic moiety is independently substituted or unsubstituted, linear or branched, cyclic or acyclic.

**[0139]** In certain embodiments, for the above five constructs, the linker is -O-, -NR<sub>G</sub>(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>NR<sub>J</sub>-, -NR<sub>G</sub>(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>NR<sub>J</sub>(C=O)(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>S-, -NR<sub>G</sub>-, -(CR<sub>H</sub>R<sub>J</sub>)<sub>k</sub>NR<sub>I</sub>-, -O(CR<sub>H</sub>R<sub>I</sub>)<sub>k</sub>NR<sub>J</sub>, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of k is independently 1-5, wherein each occurrence of R<sub>G</sub>, R<sub>H</sub>, R<sub>I</sub> or R<sub>J</sub> is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety.

**[0140]** In certain embodiments, for the above five constructs, each occurrence of A is independently selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)-ST, Le<sup>y</sup>, N3, Tn, 2,6-STn, Gb3 and TF.

**[0141]** In certain exemplary embodiments, the present invention provides a novel trimeric antigenic glycopeptide incorporating three occurrences of Gb3, to generate a novel trimeric antigenic compound having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 3. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen. In certain exemplary embodiments,  $n$  and  $q$  are each 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

**[0142]** In certain exemplary embodiments, the present invention provides a novel trimeric antigenic glycopeptide incorporating three occurrences of Gb3, to generate a novel trimeric antigenic compound having the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 0. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  and  $q$  are each 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

**[0143]** In certain exemplary embodiments, the present invention provides a novel trimeric antigenic glycopeptide incorporating TF,  $\text{Le}^y$  and Tn, to generate a novel trimeric antigenic compound having the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 0. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  and  $q$  are each 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

**[0144]** In certain other exemplary embodiments, the present invention provides a novel trimeric antigenic glycopeptide incorporating globo-H,  $\text{Le}^y$  and Tn, to generate a novel trimeric antigenic compound, as described in more detail below. In certain other exemplary embodiments, the multi-antigenic glycopeptide has the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 3. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  is 3,  $q$  is 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

[0145] In certain other exemplary embodiments, the present invention provides a novel pentameric antigenic glycopeptide incorporating globo-H, Le<sup>y</sup>, STn, TF and Tn to generate a novel pentameric antigenic compound, as described in more detail below. In certain other exemplary embodiments, the multi-antigenic glycopeptide has the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 3. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  is 3,  $q$  is 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

**[0146]** In certain embodiments, for each of the above five constructs, the linker is  $-\text{O}-$ ,  $-\text{NR}_G-$ ,  $-\text{NR}_G(\text{aliphatic})\text{NR}_J-$ ,  $-\text{NR}_G(\text{heteroaliphatic})\text{NR}_J-$ ,  $-(\text{aliphatic})\text{NR}_J-$ ,  $-(\text{heteroaliphatic})\text{NR}_J-$ ,  $-\text{O}(\text{aliphatic})\text{NR}_J-$ ,  $-\text{O}(\text{heteroaliphatic})\text{NR}_J-$ ,  $-\text{NR}_G(\text{aliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ ,  $-\text{NR}_G(\text{heteroaliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ ,  $-(\text{aliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ ,  $-(\text{heteroaliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ , -

$O(\text{aliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-O(\text{heteroaliphatic})NR_J(C=O)(CR_HR_I)_kS-$ , an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of  $k$  is independently 1-5; wherein each occurrence of  $R_G$ ,  $R_H$ ,  $R_I$  or  $R_J$  is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety, and wherein each aliphatic or heteroaliphatic moiety is independently substituted or unsubstituted, linear or branched, cyclic or acyclic.

[0147] In certain embodiments, for each of the above five constructs, the linker is  $-O-$ ,  $-NR_G(CR_HR_I)_kNR_J-$ ,  $-NR_G(CR_HR_I)_kNR_J(C=O)(CR_HR_I)_kS-$ ,  $-NR_G-$ ,  $-(CR_HR_I)_kNR_J-$ ,  $-O(CR_HR_I)_kNR_J$ , an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of  $k$  is independently 1-5, wherein each occurrence of  $R_G$ ,  $R_H$ ,  $R_I$  or  $R_J$  is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety.

[0148] In certain embodiments, for each of the above five constructs,  $q$  is 1 and the crosslinker is a fragment having the structure:

whereby said structure is generated upon conjugation of a maleimidobenzoic acid N-hydroxy succinimide ester with a linker.

[0149] *Pharmaceutical Compositions, Constructs and Uses Thereof*

[0150] As described above, the present invention provides compounds and synthetic methodologies useful in the development of novel therapeutic agents, particularly for fully synthetic cancer vaccines and/or therapeutics. In general, the compounds and glycopeptides prepared as disclosed herein can be conjugated to a protein carrier or a lipid to generate useful glycoconjugates for the treatment and/or prevention, (preferably the prevention of the recurrence), of cancer in a subject

suffering therefrom. In addition, glycoconjugates prepared by processes disclosed herein are useful in adjuvant therapies as vaccines capable of inducing antibodies immunoreactive with various tumor cells. Such adjuvant therapies may reduce the rate of recurrence of certain cancers, and increase survival rates after surgery. Clinical trials on patients surgically treated for cancer who are then treated with vaccines prepared from a cell surface differentiation antigen found in patients lacking the antibody prior to immunization, a highly significant increase in disease-free interval may be observed. Cf. P.O. Livingston, *et al.*, *J. Clin. Oncol.*, **1994**, *12*, 1036.

[0151] Thus, the present invention provides pharmaceutical compositions for treating cancer, preferably for preventing the recurrence of cancer, comprising any of the compounds of the present invention disclosed herein, as an active ingredient, optionally, though typically in combination with a pharmaceutically acceptable carrier. The pharmaceutical compositions of the present invention may further comprise other therapeutically active ingredients (*e.g.*, chemotherapeutic and/or palliative). For purposes of the invention, the term "*Palliative*" refers to treatment that is focused on the relief of symptoms of a disease and/or side effects of a therapeutic regimen, but is not curative. For example, palliative treatment encompasses painkillers, antinausea medications and anti-sickness drugs. In addition, chemotherapy, radiotherapy and surgery can all be used palliatively (that is, to reduce symptoms without going for cure; *e.g.*, for shrinking tumors and reducing pressure, bleeding, pain and other symptoms of cancer).

[0152] In certain embodiments, a method of treatment is provided comprising administering to the subject a therapeutically effective amount of any of the glycoconjugates disclosed herein, optionally in combination with a pharmaceutically acceptable carrier. The method may be applied wherein the cancer is a solid tumor or an epithelial tumor. As mentioned above, methods for the treatment of cancer (preferably for the prevention of recurrence of cancer) are provided, as well as methods for inducing antibodies in a human subject, wherein the antibodies are capable of specifically binding with human tumor cells, which comprises administering to the subject an amount of any of the glycoconjugates disclosed above effective to induce antibodies. In certain embodiments, the

carbohydrate antigen is linked to an immunogenic carrier either directly or through a crosslinker, which carrier is a protein, peptide or lipid. In certain embodiments, the carrier is Bovine Serum Albumin, polylysine or KLH. In certain other embodiments, the carrier is a lipid having the structure:

wherein  $m'$ ,  $n'$  and  $p'$  are each independently integers between about 8 and 20; and  $R_v$  is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl. In certain exemplary embodiments,  $m'$ ,  $n'$  and  $p'$  are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine (e.g., PamCys).

[0153] In certain other embodiments, the method comprises administering to the subject a therapeutically effective amount of any of the compounds and/or glycopeptides disclosed herein, in combination with an immunogenic carrier, optionally in combination with a pharmaceutically acceptable carrier. Specifically, in certain exemplary embodiments, the method comprises administering a carbohydrate antigen conjugated to an immunogenic carrier. In certain embodiments, the method comprises administering a carbohydrate antigen and an immunogenic carrier that have not been conjugated. Rather, they are administered concurrently, or successively, as separate entities. In certain other exemplary embodiments, the method comprises administering a glycopeptide of the invention conjugated to an immunogenic carrier. In certain embodiments, the method comprises administering an inventive glycopeptide that has not been conjugated to an immunogenic carrier. Rather, the glycopeptide and the immunogenic carrier are administered concurrently, or successively, as separate entities. In certain embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain exemplary embodiments, the carrier is Bovine Serum Albumin, polylysine or KLH. In certain other embodiments, the carrier is PamCys. For the purpose of the

invention, a compound/glycopeptide and a carrier are said to be administered concurrently when they are administered (i) as a single composition containing the compound/glycopeptide and the carrier, (ii) as two separate compositions or (iii) are delivered by separate routes within a short enough period of time that the effective result is equivalent to that obtained when both compound/glycopeptide and carrier are administered as a single composition.

[0154] In still other embodiments, the present invention provides the related method of inducing antibodies which further comprises co-administering an immunological adjuvant, or a combination of immunological adjuvants. Specifically, when a multi-antigenic glycopeptide comprising at least two different antigenic carbohydrate domains is used, it is possible to induce at least two different types of antibodies. In certain embodiments, each carbohydrate antigen present on the peptide backbone elicits an antibody type specific to that carbohydrate antigen. In certain other embodiments, the antibodies produced are those that recognize at least one carbohydrate antigen present on the glycopeptide. In certain embodiments, an inventive multi-antigenic glycopeptide, when administered to a subject, produces antibodies to a subset of the carbohydrate antigens present on the glycopeptide backbone. In certain embodiments, some of the antibodies produced recognize two or more carbohydrate antigens of the glycopeptide. In certain exemplary embodiments, the inventive glycopeptides comprise carbohydrate domains, or truncated or elongated versions thereof, that are found on tumor cells.

[0155] In certain exemplary embodiments, the multi-antigenic glycopeptide is a trimeric construct having the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 0. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  and  $q$  are each 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

**[0156]** In certain other exemplary embodiments, the multi-antigenic glycopeptide has the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 3. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  is 3,  $q$  is 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

[0157] In certain other exemplary embodiments, the multi-antigenic glycopeptide has the structure:

wherein each occurrence of  $R_x$  and  $R_y$  is independently hydrogen or a protecting group;  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or an immunogenic carrier. In certain exemplary embodiments, the immunogenic carrier is a protein, peptide or lipid. In certain embodiments, each occurrence of  $n$  is 3. In certain other embodiments,  $q$  is 0. In still other embodiments,  $R$  is KLH, Bovine Serum Albumin or polylysine. In yet other embodiments, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments,  $t$  is 3 and  $v$  is 1. In certain exemplary embodiments, each occurrence of  $R_x$  is hydrogen and each occurrence of  $R_y$  is Ac. In certain exemplary embodiments,  $n$  is 3,  $q$  is 0,  $R$  is KLH and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each integers from 1-6. In certain embodiments, one or more of the carbohydrate domains is/are  $\alpha$ -linked to the peptide backbone.

**[0158]** In certain embodiments, for each of the above three constructs, the linker is  $-\text{O}-$ ,  $-\text{NR}_G-$ ,  $-\text{NR}_G(\text{aliphatic})\text{NR}_J-$ ,  $-\text{NR}_G(\text{heteroaliphatic})\text{NR}_J-$ ,  $-(\text{aliphatic})\text{NR}_J-$ ,  $-(\text{heteroaliphatic})\text{NR}_J-$ ,  $-\text{O}(\text{aliphatic})\text{NR}_J-$ ,  $-\text{O}(\text{heteroaliphatic})\text{NR}_J-$ ,  $-\text{NR}_G(\text{aliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ ,  $-\text{NR}_G(\text{heteroaliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ ,  $-(\text{aliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ ,  $-(\text{heteroaliphatic})\text{NR}_J(\text{C}=\text{O})(\text{CR}_H\text{R}_I)_k\text{S}-$ , -

$O(\text{aliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-O(\text{heteroaliphatic})NR_J(C=O)(CR_HR_I)_kS-$ , an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of  $k$  is independently 1-5; wherein each occurrence of  $R_G$ ,  $R_H$ ,  $R_I$  or  $R_J$  is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety, and wherein each aliphatic or heteroaliphatic moiety is independently substituted or unsubstituted, linear or branched, cyclic or acyclic.

**[0159]** In certain embodiments, for each of the above three constructs, the linker is  $-O-$ ,  $-NR_G(CR_HR_I)_kNR_J-$ ,  $-NR_G(CR_HR_I)_kNR_J(C=O)(CR_HR_I)_kS-$ ,  $-NR_G-$ ,  $-(CR_HR_I)_kNR_I-$ ,  $-O(CR_HR_I)_kNR_J$ , an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of  $k$  is independently 1-5, wherein each occurrence of  $R_G$ ,  $R_H$ ,  $R_I$  or  $R_J$  is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety.

**[0160]** In certain embodiments, for each of the above three constructs,  $q$  is 1 and the crosslinker is a fragment having the structure:

whereby said structure is generated upon conjugation of a maleimidobenzoic acid N-hydroxy succinimide ester with a linker.

**[0161]** In certain embodiments, the adjuvant is a saponin adjuvant (see, *e.g.*, Marciani *et al.*, *Vaccine*, **2000**, 18, 3141, US Patent No.: 6,080,725 and 5,977,081, the entire contents of which are hereby incorporated by reference). One example of a preferred saponin adjuvant includes, but is not limited to, GPI-0100, (Galenica Pharmaceuticals, Inc., Frederick, MD) which is a semi-synthetic adjuvant derived by modifying selected natural saponins.

GPI-0100

[0162] Saponins isolated from *Quillaja saponaria* Molina contain two acyl moieties, a normonoterpene carboxylic acid and a normonoterpene carboxylic acid glycoside, which are linked linearly to a fucosyl residue attached at position C-28. It has been hypothesized that these lipophilic acyl groups may be responsible for these saponins' toxicity and their ability to stimulate cytotoxic T cells against exogenous antigens. The linkage between the fucosyl residue and the acyl group is unstable and hydrolyzes under mild conditions ( $\text{pH} \geq 6$ ) with concomitant loss of saponins capability to stimulate cell-mediated immune response. Unlike their saponin precursors, GPI-0100 adjuvants comprise a stable non-toxic lipophilic moiety in the saponin's glucuronic residue. Methods for preparing these semi-synthetic adjuvants are well-known in the art. For example, GPI-0100 adjuvants may be prepared by hydrolizing quillaja saponins (which are commercially available) under basic conditions to yield the corresponding deacylated product. The deacylated intermediate may then be reacted with a suitable amine reagent using standard carboxylic acid moiety activation methodology to give the desired compounds. A wide variety of procedures are effective for extrating saponin compounds. They are generalized as follows: (i) defatting of the organic matter with a hydrophobic organic solvent such as petroleum ether; (ii) extraction with a suitable alcohol (*e.g.*,

methanol or ethanol) or alcohol-water mixture; (iii) evaporation of the carinol solvent; and (iv) partitioning of the dried alcohol extract between water and n-butanol saturated with water, followed by precipitation of the crude saponins from the n-butanol/water with a suitable organic solvent (*e.g.*, diethyl ether). Purification of the saponin extract may require multiple separation steps. For example, preliminary fractionation may be carried out using conventional open column chromatography or flash chromatography on silica gel, in combination with a more sophisticated chromatographic technique such as High Pressure Liquid Chromatography (HPLC), droplet counter-current liquid chromatography (DCCC) or centrifugal Liquid Chromatography (RLCC). The integration of these techniques with preparative TLC typically affords separated and purified saponins.

[0163] In certain other preferred embodiments, the adjuvant is bacteria or liposomes. In certain examples, the adjuvant includes but is not limited to, *Salmonella minnesota* cells, bacille Calmette-Guerin or QS21.

[0164] It will be appreciated that the magnitude of the therapeutic dose of the compounds of the invention will vary with the nature and severity of the condition to be treated and with the particular compound and its route of administration. In general, the daily dose range for anticancer activity lies in the range of 0.0001 to 1.0 mg/kg of body weight in a mammal, although the present invention is not intended to be limited by this range.

[0165] Any suitable route of administration may be employed for providing a mammal, especially a human, with an effective dosage of a compound disclosed herein. For example, oral, rectal, topical, parenteral, ocular, pulmonary, nasal, etc. routes may be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, creams, ointments, aerosols, etc. In preferred embodiments, the effective dosage is employed using a syringe injection.

[0166] The inventive compositions include those suitable for oral, rectal, topical (including transdermal devices, aerosols, creams, ointments, lotions and dusting powders), parenteral (including subcutaneous, intramuscular, and intravenous), ocular (ophthalmic), pulmonary (nasal or buccal inhalation) or nasal administration. Although the most suitable route in any given case will depend largely on the nature and severity of the condition being treated and on the nature of

the active ingredient. They may be conveniently presented in unit dosage form and prepared by any of the methods well known in the art of pharmacy.

[0167] In preparing oral dosage forms, any of the unusual pharmaceutical media may be used, such as water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents, and the like in the case of oral liquid preparations (*e.g.*, suspensions, elixers and solutions); or carriers such as starches, sugars, microcrystalline cellulose, diluents, granulating agents, lubricants, binders, disintegrating agents, etc., in the case of oral solid preparations are preferred over liquid oral preparations such as powders, capsules and tablets. If desired, capsules may be coated by standard aqueous or non-aqueous techniques. In addition to the dosage forms described above, the compounds of the invention may be administered by controlled release means and devices.

[0168] Pharmaceutical compositions of the present invention suitable for oral administration may be prepared as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient in powder or granular form or as a solution or suspension in an aqueous or nonaqueous liquid or in an oil-in-water or water-in-oil emulsion. Such compositions may be prepared by any of the methods known in the art of pharmacy. In general, compositions are prepared by uniformly and intimately admixing the active ingredient with liquid carriers, finely divided solid carriers, or both and then, if necessary, shaping the product into the desired form. For example, a tablet may be prepared by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granule optionally mixed with a binder, lubricant, inert diluent or surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine, a mixture of the powdered compound moistened with an inert liquid diluent.

[0169] It will be appreciated by one of ordinary skill in the art, however, that the most suitable route for administration will depend largely on the nature and severity of the condition being treated and on the nature of the active ingredient. As discussed above, the inventive therapeutics may be conveniently presented in unit dosage form and prepared by any of the methods well known in the art of pharmacy.

[0170] As discussed above, in one embodiment of the present invention, the inventive n-alkenyl glycosides can be conjugated either directly or through a crosslinker to an appropriate carrier (*e.g.*, KLH) to generate a synthetic tumor antigen. In general, a typical conjugation strategy that can be employed involves a reductive coupling of a glycoside which terminates in a glycoaldehyde, with the intended protein carrier, or lipid, presumably at the  $\epsilon$ -amino acid residues of exposed lysines. (M.A. Bernstein; L.D. Hall, *Carbohydr. Res.* **1980**, 78, C1; R.V. Lemieux *Chem. Soc. Rev.* **1978**, 7, 423).

[0171] Thus, in another aspect, the present invention provides synthetic constructs, whereby novel antigenic structures, as described herein, are conjugated to immunogenic carriers (*e.g.*, proteins, peptides or lipids). It will also be appreciated by one of ordinary skill in the art that, in the generation of a synthetic construct, more than one n-alkenyl moiety or glycopeptide moiety can ultimately be conjugated to a carrier protein to generate the synthetic vaccine. Thus, in addition to the conjugated glycopeptide structures as provided herein, constructs having the general structure as depicted below are also provided:

wherein A is a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein R<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub> and R<sub>9</sub> is

independently hydrogen, OH,  $\text{OR}^{\text{i}}$ ,  $\text{NHR}^{\text{i}}$ ,  $\text{NHCOR}^{\text{i}}$ , F,  $\text{CH}_2\text{OH}$ ,  $\text{CH}_2\text{OR}^{\text{i}}$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $\text{R}^{\text{i}}$  is independently hydrogen, CHO,  $\text{COOR}^{\text{ii}}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein  $\text{Y}$  and  $\text{Z}$  are independently NH or O; wherein  $k$ ,  $l$ ,  $r$ ,  $s$ ,  $t$ ,  $u$ ,  $v$  and  $w$  are each independently 0, 1 or 2; with the proviso that the  $v$  and  $w$  bracketed structures represent furanose or pyranose moieties and the sum of  $l$  and  $k$  is 1 or 2, and the sum of  $s$  and  $u$  is 1 or 2, and with the proviso that  $v$  and  $w$  are not simultaneously 0; wherein  $\text{R}'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $\text{R}_{10}$ ,  $\text{R}_{11}$ ,  $\text{R}_{12}$ ,  $\text{R}_{13}$ ,  $\text{R}_{14}$  and  $\text{R}_{15}$  is independently hydrogen, OH,  $\text{OR}^{\text{iii}}$ ,  $\text{NHR}^{\text{iii}}$ ,  $\text{NHCOR}^{\text{iii}}$ , F,  $\text{CH}_2\text{OH}$ ,  $\text{CH}_2\text{OR}^{\text{iii}}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $\text{R}_{16}$  is hydrogen, COOH,  $\text{COOR}^{\text{ii}}$ ,  $\text{CONHR}^{\text{ii}}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $\text{R}^{\text{iii}}$  is hydrogen, CHO,  $\text{COOR}^{\text{iv}}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $\text{R}^{\text{ii}}$  and  $\text{R}^{\text{iv}}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

wherein  $n$  is 0-8; wherein the carrier is an immunogenic carrier, wherein said carrier is linked directly or through a crosslinker; and wherein  $t'$  is at least 1. In certain preferred embodiments,  $n$  is 4. In certain embodiments, the immunogenic carrier is a protein, peptide or lipid, including, but not limited to Bovine Serum Albumin, KLH and PamCys. In certain exemplary embodiments,  $t'$  is in the range 20-600. In still other preferred embodiments, the carbohydrate determinant is

selected from the group consisting of Globo-H, KH-1, glycophorin, STN, (2,3)ST, N3, Tn, TF, 2,6-STn, Gb3 and Le<sup>y</sup>. In yet other preferred embodiments, the carbohydrate determinant is fucosyl GM1, which has the structure as depicted above, and as shown in Figure 1. In certain embodiments, one or more of the alkylglycoside moieties is/are attached to the carrier via an -NH- moiety present on the carrier.

**[0172]** It will be appreciated that because certain of the inventive compounds produced terminate in an alkenyl linkage, in a typical protocol according to the present invention, conversion to an aldehyde is first required. Thus, in but one exemplary embodiment, an inventive synthetic globo-H tumor antigen is prepared from an n-alkenyl globo-H glycoside. As described in Example 2, this procedure involves exposing the n-alkenyl globo-H glycoside to oxidative conditions, in this case ozonolysis, followed by reductive work-up to yield an aldehyde intermediate to generate a vaccine glycoconjugate. Subsequent hydrolytic carbohydrate analysis reveals approximately 350 carbohydrate residues/molecule of carrier protein, as described in Example 2.

**[0173]** In yet another example, a fucosyl GM1-KLH glycoconjugate is generated according to the method of the present invention, as discussed in Example 1. Notably, prior to conjugation studies, synthetic n-pentenyl fucosyl GM1 was shown to bind to monoclonal antibody F12 in ELISA and immune thin layer chromatography assays. Inhibition studies revealed that preincubation of F12 with antibody completely inhibits reactivity of natural fucosyl GM1, with the antibody. Clearly, the synthetic fucosyl GM1 pentenyl glycoside provides the antigenic epitope with which F12 reacts on SCLC cells.

**[0174]** Additionally, once a synthetic vaccine has been derivatized and characterized, mouse immunological studies can be performed to assess the potency and/or specificity of the novel tumor vaccines, as described in Example 6 herein.

### Equivalents

**[0175]** The representative examples which follow are intended to help illustrate the invention, and are not intended to, nor should they be construed to, limit the scope of the invention. Indeed, various modifications of the invention and

many further embodiments thereof, in addition to those shown and described herein, will become apparent to those skilled in the art from the full contents of this document, including the examples which follow and the references to the scientific and patent literature cited herein. In but one illustrative example, protecting groups play an important role in the synthesis of the carbohydrate domains and synthetic conjugates, as described herein; however it will be appreciated by one of ordinary skill in the art that the present invention encompasses the use of various alternate protecting groups known in the art. Those protecting groups used in the disclosure including the Examples below are merely illustrative.

[0176] It should further be appreciated that the contents of those cited references are incorporated herein by reference to help illustrate the state of the art. The following examples contain important additional information, exemplification and guidance which can be adapted to the practice of this invention in its various embodiments and the equivalents thereof.

#### Exemplification

[0177] *A. Example 1: Synthesis of fucosyl GM1 pentenyl glycoside*

[0178] *1) Discussion of Synthesis:*

[0179] As discussed above, in one aspect of the invention, the synthesis of fucosyl GM1 pentenyl glycoside is provided. In one embodiment of the present invention, this was achieved similarly to the methodology employed in the synthesis of MBr1 antigen, Globo-H (see, Park *et al.*, *J. Am. Chem. Soc.* **1996**, *118*, 11488). For example, as shown in Figure 2, the synthesis of the ABC trisaccharide starting from the known protected lactal derivative **2**, was first undertaken (Kwon, O.; Danishefsky, S.J. *J. Am. Chem. Soc.* **1998**, *120*, 1588). Selective sialylation of the C3' equatorial hydroxyl in **2** proceeded smoothly with phosphite donor **3** (Sim *et al.*, *J. Am. Chem. Soc.* **1993**, *115*, 2260; Chappell *et al.*, *Tetrahedron* **1997**, *53*, 11109) to yield the glycal **4** as the only observable isomer in 75% yield. In addition, propionitrile was employed as the solvent because of the necessity to perform the reaction at low temperatures. Use of elevated temperatures in acetonitrile as the solvent resulted in diminished anomeric selectivity, regioselectivity and lower chemical yields. The key DEF trisaccharide was synthesized as previously

described in the Globo-H synthesis (Park *et al. J. Am. Chem. Soc.* **1996**, *118*, 11488). The requisite thioethyl donor **5** is shown in Figure 2. Based on previous experience, it was expected that this specific donor would favor  $\beta$ -glycosidation via sulfonamido participation under the close guidance of the "proximal hydroxyl" directing effect (see asterisk) (see also, Park *et al. J. Am. Chem. Soc.* **1996**, *118*, 11488; Kwon *et al. J. Am. Chem. Soc.* **1998**, *120*, 1588), and the results confirmed this expectation. In an experiment directed at "proof of principle", reaction of **5** with 5.0 equivalents of MeOTf (Lonn, H. *Carbo. Res.* **1985**, *134*, 105; Lonn, H. *J. Carbohydr. Chem.* **1987**, *6*, 301) in the presence of **4** gave the desired hexasaccharide **6** in 23 % yield, as shown in Figure 3. Although direct deprotection of this compound was not achieved to yield the desired compound, in an effort to find a hexasaccharide which was suitable for global deprotection, replacement of the reducing end glycal was considered. Such a replacement would also be potentially useful as a linker capable of being modified to allow for conjugation to a protein carrier or lipid.

[0180] In but one example, the use of a n-pentenyl glycoside was considered (For a review of n-pentenyl glycosides, see Fraser-Reid *et al.*, *Synlett*, **1992**, 927; Udodong *et al. J. Am. Chem. Soc.* **1993**, *115*, 7886; Merritt *et al. J. Am. Chem. Soc.* **1994**, *116*, 8334; Fraser-Reid *et al.* **1990**, *55*, 6068; Mootoo *et al. J. Am. Chem. Soc.* **1988**, *110*, 2662; Mootoo *et al. J. Am. Chem. Soc.* **1989**, *111*, 8540 and references therein). N-pentenyl glycosides are stable to a range of reaction conditions and reagents, but are readily activated for glycosidation reactions by treatment with a halogen oxidant. As a result of their stability and the neutral conditions required for their activation, pentenyl glycosides have been demonstrated to be valuable linkages for mechanistic and synthetic studies. Additionally, a terminal pentenyl group, or more generally a terminal alkenyl group, could also provide a handle for bioconjugation. Thus, in one embodiment, glycal **6a** was subjected to epoxidation under standard procedures with 3,3-dimethyldioxirane (Figure 3). Reaction with pentenyl alcohol and anhydrous zinc chloride (Gordon *et al. Carbohydrate Res.* **1990**, *206*, 361) afforded the glycoside **7** in 65% yield. Indeed, with the pentenyl glycoside in place, global deprotection of **7** was possible. The sequence shown in Figure 3 furnished the peracetylated hexasaccharide lactone **8** in 46 % yield (5

steps). Removal of the acetates with sodium methoxide followed by saponification of the resulting methyl ester yielded the target, fucosyl GM1 pentenyl glycoside, **1b**. The assignment of structure **1b** was based on  $^1\text{H}$  and  $^{13}\text{C}$  NMR analysis of **1b**, in conjunction with characterization of intermediates en route to the final structure, and is supported by high resolution mass spectrometry.

[0181] In yet another embodiment, in an effort to produce significant quantities of this epitope for pre-clinical, and eventually clinical evaluation, a more efficient synthetic route was developed utilizing a glycoside at the reducing end at the acceptor, rather than a glycal. As shown in Figure 4, pentenyl lactoside was first investigated. For this purpose, lactose octaacetate was converted to the known bromide **9** (Reithal, Y. *J. Am. Chem. Soc.* 1952, 74, 4210; Dasgupta *et al. Carbohydr. Res.* 1994, 264, 155). Reaction of this compound with pentenyl alcohol under promotion by silver carbonate delivered the desired pentenyl glycoside, **10**, on 100 g scale (Rodriguez, *et al. Aust. J. Chem.* 1990, 43, 665). An analogous coupling to produce **9** using silver triflate as promoter resulted in only a 17% yield of the desired product. Removal of the acetates yielded lactoside **11**. Again, the C3' and C4' hydroxyl groups were engaged, this time as the dimethyl ketal **12**. This reaction, as currently conducted, was accompanied by formation of minor amounts of 4,6-acetonide (Catelani *et al. Carb. Res.* 1988, 182, 297). Perbenzylation of **12** to give **13** followed by acetonide removal with aqueous acetic acid yielded the desired AB acceptor **14**. Sialylation using phosphite donor **3** (Figure 2) proceeded in comparable yield to give trisaccharide acceptor, **15**.

[0182] Finally, turning to the desired fucosyl GM1, coupling of donor **5** with a 2.0 molar excess of the acceptor **15** containing the pentenyl linker proceeded with MeOTf promotion (1.5 equivalents x 2) in excellent yield (70%; see Figure 5). Global deprotection under identical conditions as in Figure 4, yielded the characterized hexasaccharide **1b**.

[0183] Attention was then directed to the final goal of developing a glycoconjugate. Synthetic **1b** was subjected to conjugation to carrier protein KLH, as depicted in Figure 6. The protocol started with ozonolysis, thereby producing the uncharacterized aldehyde derivative. This step was followed by coupling to KLH using reductive amination under the agency of sodium cyanoborohydride.

Presumably coupling of the carbohydrate had occurred with the  $\epsilon$ -amino group of lysine residues in the KLH. Hydrolytic carbohydrate analysis revealed approximately 331 carbohydrate residues per molecule of KLH to generate **1c**.

**[0184]**                      *2) Experimentals*

**[0185]**                      **Peracetyl pentenyl- $\beta$ -D-lactoside (10).** To a cooled (ice bath) suspension of lactose octaacetate (100.0 g, 147.7 mmol), glacial acetic acid (30 mL) and acetic anhydride (30 mL) was added 100 mL of 30% HBr in AcOH dropwise over a period of 60 minutes. The reaction mixture stirred for 1 hour and the ice bath was removed. Upon stirring for an additional 2 hours at room temperature, the reaction became a homogeneous yellow solution. The solution was diluted with H<sub>2</sub>O (1000 mL) and extracted with CHCl<sub>3</sub> (3x400 mL). The organic extracts were washed with H<sub>2</sub>O (2x1000 mL), satd. NaHCO<sub>3</sub> (3x500 mL), dried over MgSO<sub>4</sub> and concentrated. The  $\alpha$ -bromo product **9** was azeotroped with anhydrous benzene and dried under high vacuum to yield 98.8 g (96%) of the lactosyl bromide which was used without further purification.

**[0186]**                      To a suspension of Ag<sub>2</sub>CO<sub>3</sub> (100 g, 362.6 mmol), freshly activated molecular sieves (15 g) and a crystal of I<sub>2</sub> in 400 mL CH<sub>2</sub>Cl<sub>2</sub> was added pentenyl alcohol (5.0 equiv., 73.4 mL) and then the lactosyl bromide **9** (98.8 g, 141.4 mmol) in 400 mL of CH<sub>2</sub>Cl<sub>2</sub>. After stirring in the dark at room temperature for 16 hours, the reaction was filtered through a plug of celite with additional CH<sub>2</sub>Cl<sub>2</sub> and concentrated to a yellow oil which was purified by flash column chromatography (10% EtOAc/hexanes->50% EtOAc/hexanes) to yield 74.7 g (75%) of the pentenyl lactoside **10** as a white foam.  $[\alpha]^{22}_D -48.9^\circ$  (*c* 7.5, CHCl<sub>3</sub>); IR (film CHCl<sub>3</sub>) 2941, 1751, 1369, 1224, 1054 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  5.60 (m, 1H), 5.17 (d, 1H, J=2.7 Hz), 5.02 (m, 1H), 4.93 (dd, 1H, J=7.9, 10.3 Hz), 4.85 (d, 1H, J=1.6 Hz), 4.78 (m, 2H), 4.71 (dd, 1H, J=9.6, 7.9 Hz), 4.30 (m, 3H), 3.93 (m, 3H), 3.66 (m, 3H), 3.45 (m, 1H), 3.30 (m, 1H), 1.98 (s, 3H), 1.94 (s, 3H), 1.91 (m, 2H), 1.89 (s, 3H), 1.88 (s, 6H, 2xCH<sub>3</sub>), 1.87 (s, 3H), 1.79 (s, 3H), 1.49 (m, 2H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz)  $\delta$  170.33, 170.28, 170.09, 170.00, 169.74, 69.54, 169.01, 137.72, 115.00, 101.01, 100.51, 76.27, 72.76, 72.48, 71.64, 70.94, 70.58, 69.23,

69.01, 66.52, 61.97, 60.73, 29.75, 28.49, 20.80, 20.75, 20.64, 20.57, 20.45; HRMS (FAB) calcd. for  $C_{31}H_{44}O_{18}Na$   $[M+Na]^+$  727.2425, found 727.2418.

**[0187] Pent-4-enyl 3', 4'-O-acetonide- $\beta$ -D-lactoside (12).** Peracteylated pentenyl lactoside, **10**, (18.2 g, 25.8 mmol) was dissolved in 300 mL of anhydrous MeOH and 2.0 mL of NaOMe (25% in MeOH) was added. The reaction stirred at rt for 16 hours and was neutralized with Dowex- $H^+$  (pH 5-6). The reaction was filtered with additional MeOH and concentrated to a white solid (10.6 g, quantitative) which was used without further purification. Pentenyl- $\beta$ -D-lactoside **11**:  $^1H$  NMR ( $D_2O$ , 400 MHz)  $\delta$  5.81 (m, 1H), 5.00 (dd, 1H,  $J=17.3, 1.9$  Hz), 4.92 (dd, 1H,  $J=8.9$  Hz), 4.74 (m, 1H), 4.39 (d, 1H,  $J=8.0$  Hz), 4.35 (d, 1H,  $J=7.8$  Hz), 3.72-3.42 (m, 12H), 3.21 (m, 1H), 2.06 (m, 2H), 1.63 (m, 2H);  $^{13}C$  NMR ( $D_2O$ , 100 MHz)  $\delta$  141.27, 117.31, 105.42, 104.54, 80.85, 77.84, 77.24, 76.92, 75.33, 75.00, 73.44, 72.47, 71.03, 63.52, 62.56, 31.83, 30.48.

**[0188]** To pentenyl lactoside **11** (10.6 g, 25.8 mmol) was added 200 mL acetone, 26 mL of dimethoxypropane and *p*-toluenesulfonic acid (491 mg, 0.1 equiv.). The suspension stirred at room temperature overnight at which point the reaction was homogeneous. The reaction was concentrated and purified by flash column chromatography (100% EtOAc  $\rightarrow$  2% MeOH in EtOAc) to give 5.1 g (44%) of the 3,4-acetonide as a white solid and 1.27 g of the 4,6-acetonide as a white solid. **3,4-acetonide, 12**:  $[\alpha]^{22}_D$  79.0° (0.96c, MeOH); IR 3422, 2980, 2933, 2870, 1242, 1073  $cm^{-1}$ ;  $^1H$  NMR (MeOH, 400 MHz)  $\delta$  5.83 (m, 1H), 5.00 (dd, 1H,  $J=17.1, 3.4$  Hz), 4.92 (dd, 1H,  $J=10.2, 2.0$  Hz), 4.34 (d, 1H,  $J=8.2$  Hz), 4.25 (d, 1H,  $J=7.8$  Hz), 4.17 (dd, 1H,  $J=5.5, 2.1$  Hz), 4.02 (dd, 1H,  $J=7.2, 5.5$  Hz), 3.91 (m, 3H), 3.88-3.73 (m, 5H), 3.55-3.47 (m, 3H), 3.42 (m, 1H), 3.38 (m, 1H), 3.21 (m, 1H), 2.13 (m, 2H), 1.67 (m, 2H), 1.45 (s, 3H), 1.30 (m, 3H);  $^{13}C$  NMR (MeOH, 100 MHz)  $\delta$  139.42, 115.20, 111.04 (O-C-O), 104.16, 104.09, 80.94, 80.77, 76.29, 76.25, 75.27, 75.00, 74.76, 74.39, 62.36, 61.82, 31.18 ( $CH_3$ ), 30.02, 28.41, 26.51 ( $CH_3$ ); HRMS (Fab) calcd. for  $C_{20}H_{34}O_{11}Na$   $[M+Na]^+$  473.1998, found 473.1985. **4,6-acetonide**:  $[\alpha]^{22}_D$  -216.0° (c 1.14, MeOH); IR 3364, 2926, 2870, 1380  $cm^{-1}$ ;  $^1H$  NMR (MeOH, 400 MHz)  $\delta$  5.79 (m, 1H), 4.98 (dd, 1H,  $J=17.0, 1.8$ ), 4.90 (dd, 1H,  $J=10.2, 1.0$ ), 4.35 (d,

[0193] **Compound 1b.** To a solution of the hexasaccharide (130 mg, 0.0509 mmol) in THF (2.0 mL) was added glacial AcOH (10.0 equiv., 29  $\mu$ L) and TBAF (1.0 M THF, 10.0 equiv., 0.509 mL). The reaction stirred at rt overnight, was poured into ice water and extracted with EtOAc (3x50 mL). The organic extracts were washed with satd. NaHCO<sub>3</sub> (50 mL) and brine (50 mL), dried over MgSO<sub>4</sub> and concentrated to an oil which was purified through a short plug of silica gel with EtOAc. The resulting triol was dissolved in anhydrous MeOH (2.5 mL) and sodium methoxide was added (0.250 mL of a 25% solution in MeOH). The reaction stirred at rt for 18 hours and then 0.5 mL of THF and 0.5 mL of H<sub>2</sub>O were added. Stirring at rt for an additional 24 hours was followed by neutralization with Dowex-H<sup>+</sup>, filtration with MeOH washings and concentration. The crude material was allowed to dry under high vacuum for 1 day. To the resulting white solid was added THF (0.5 mL) and condensed liquid NH<sub>3</sub> (~10 mL) at -78 °C. Sodium (~50 mg) was added and the resulting blue solution stirred at -78 °C for 1.5 hours. The reaction

was quenched with anhydrous MeOH (~5 mL), brought to rt and concentrated with a stream of dry N<sub>2</sub> to a volume of ~ 2 mL. The reaction was neutralized with Dowex-H<sup>+</sup>, filtered with MeOH washings and concentrated to a white solid. The white solid was dissolved in 1.0 mL pyridine and 1.0 mL CH<sub>2</sub>Cl<sub>2</sub> and cooled to 0 °C. A crystal of DMAP was added followed by acetic anhydride (1.0 mL). The ice bath was removed and the reaction stirred at rt overnight. Concentration followed by purification by flash column chromatography (gradient elution 75% EtOAc/hexanes -> 100% EtOAc -> 5% MeOH/EtOAc) gave 44 mg (46%) of **8** as a white solid: <sup>1</sup>H NMR (MeOH, 400 MHz) δ 8.02 (d, 1H, J=9.9 Hz), 7.87 (d, 1H, J=9.2 Hz), 5.76 (m, 1H), 5.49 (m, 1H), 5.39 (d, 1H, J=2.9 Hz), 5.34-5.31 (m, 2H), 5.22 (d, 1H, J=3.4 Hz), 5.19 (d, 1H, J=4.1 Hz), 5.17 (d, 1H, J=3.5 Hz), 5.12-5.05 (m, 3H), 4.97 (dd, 1H, J=16.8, 1.7 Hz), 4.91 (dd, 1H, J=10.0, 1.7 Hz), 4.81-4.75 (m, 3H), 4.65-4.60 (m, 2H), 4.52 (d, 1H, J=7.9 Hz), 4.48-4.44 (m, 2H), 4.37 (dd, 1H, J=10.0, 2.5 Hz), 4.28 (dd, 1H, J=12.5, 2.4 Hz), 4.22-4.18 (m, 2H), 4.14-3.99 (m, 9H), 3.96-3.92 (m, 2H), 3.89 (d, 1H, J=2.9 Hz), 3.88-3.77 (m, 4H), 3.72-3.62 (m, 3H), 3.51-3.45 (m, 1H), 2.74 (dd, 1H, J=11.3, 4.5 Hz), 2.19 (s, 3H), 2.13 (s, 3H), 2.11 (s, 3H), 2.10 (s, 3H), 2.09 (s, 3H), 2.08 (s, 3H), 2.06 (s, 3H), 2.05 (s, 3H), 2.02 (s, 3H), 2.01 (s, 3H), 2.00 (s, 3H), 1.99 (s, 3H), 1.98 (s, 3H), 1.97 (s, 3H), 1.95 (s, 3H), 1.94 (s, 3H), .91 (s, 3H), .180 (s, 3H), 1.61 (m, 2H), 1.14 (d, 3H, J=6.4 Hz), 3 protons buried beneath acetates (2 Pn, 1 C3ax); <sup>13</sup>C NMR (MeOH, 100 MHz) δ 174.64, 173.64, 172.98, 172.89, 172.63, 172.56, 172.48, 172.44, 172.34, 172.27, 172.04, 171.99, 171.76, 171.73, 171.62, 171.35, 171.25, 139.23, 115.47, 104.62, 103.26, 101.86, 101.63, 100.78, 97.31, 78.22, 76.53, 75.08, 74.69, 74.29, 73.91, 73.53, 72.94, 72.71, 72.56, 72.16, 72.06, 71.89, 71.74, 70.19, 69.87, 69.33, 69.11, 68.92, 65.96, 65.65, 63.68, 63.52, 62.69, 54.01, 53.09, 50.60, 40.19, 31.09, 29.96, 24.17, 24.06, 22.73, 21.76, 21.59, 21.46, 21.20, 21.06, 20.89, 20.75, 20.63, 20.55, 16.52.

**[0194]** The peracetate (40 mg) was dissolved in anhydrous MeOH (2.0 mL) and 150 µL of sodium methoxide was added (25% solution in MeOH). The reaction stirred at rt for 18 hours and then 0.5 mL of THF and 0.5 mL of H<sub>2</sub>O was added. The reaction stirred for another 24 hours at rt. Neutralization with Dowex-H<sup>+</sup> (~pH 6-7) was followed by filtration with MeOH washings, concentration and purification

**[0197]**        **3) Conjugation studies:**

**[0198]**        As described herein and as shown in Figure 6, the pentenyl group in FucGM1 was converted to an aldehyde group by ozonolysis and linked to  $-NH_2$  groups of KLH by reductive amination method in the presence of sodium cyanoborohydride as described for globo H (see, Ragupathi G, Park TK, Zhang S, Kim II, Graeber L, Adluri S, Lloyd KO, Danishefsky SJ and Livingston PO. Immunization of mice with conjugates of fully synthetic hexasaccharide globo H results in antibody against human cancer cells: a combined chemical immunological approach to the fashioning of an anticancer vaccine. *Angewandte Chem. Int. Ed Engl.* 36: 125-128. 1997.). In the case of cross-linker method the aldehyde group obtained through ozonolysis was first reacted with hydrazide of MMCCH (4-(maleimidomethyl) cyclohexane-1-carboxyl hydrazide) and reacted with thiolated KLH as described in Ragupathi G, Koganty RR, Qiu D, Lloyd KO and Livingston PO. A novel and efficient method for synthetic carbohydrate conjugate vaccine preparation: Synthesis of sialyl Tn-KLH conjugate using a 4-(4-N-maleimidomethyl) cyclohexane-1-carboxyl hydrazide (MMCCH) linker arm. *Glycoconjugate J.*, 15: 217-221, 1998). For example, 4 mg of FucGM1 pentenyl glycoside in methanol was stirred at  $-78^\circ C$  in a dry-ice/ethanol bath and ozone gas was passed through the solution for 10 min under vigorous stirring. The excess of ozone was then displaced with nitrogen over a period of 5 min. Methyl sulfide (100  $\mu l$ ) was added and the reaction mixture stirred at room temperature for 2 hours and distributed equally in two vials. The solvent was removed under a stream of nitrogen. The resulting white solid was used directly in the subsequent conjugation steps.

**[0199]**        **a) Direct Conjugation of FucGM1-aldehyde with KLH:**

**[0200]**        Two mg FucGM1-aldehyde was dissolved in 1 ml of 0.1M phosphate buffered saline (PBS) pH 7.2 and 4 mg of KLH in PBS. Two mg sodium cyanoborohydride was added and the mixture incubated under gentle agitation at

37°C for 48 h. After 16 h, an additional 1.0 mg sodium cyanoborohydride was added and the incubation continued. The unreacted FucGM1 aldehyde was removed completely with multiple washes using a Amicon Centriprep with molecular weight cut-off value 30000 dalton, with 6-7 changes of PBS at 4°C.

**[0201]        b)    *Conjugation of FucGM1-aldehyde through MMCCH to thiolated KLH:***

**[0202]        *Preparation of FucGM1-MMCCH***

**[0203]**        Two mg of FucGM1-aldehyde was dissolved in 1 ml of 0.1M sodium acetate buffer pH 5.5, and 4 mg of MMCCH in 100 µl of dimethyl sulfoxide (DMSO) was added. The reaction mixture was incubated at room temperature for 15 min with gentle stirring. At the end of 15 min 2 mg of solid sodium cyanoborohydride was added and the incubation continued at room temperature for 2 h. Unreacted MMCCH was removed in a Sephadex G10 column equilibrated previously with 0.1 M sodium phosphate buffer pH 6.0 containing 5 mM EDTA and eluted with the same buffer. The fractions positive for FucGM1 by TLC with orcinol were combined.

**[0204]        *Addition of sulfhydryl groups to KLH***

**[0205]**        2-Iminothiolane (2 mg) dissolved in thiolation buffer (50 mM triethanolamine, 0.15 M NaCl, 5 mM EDTA, pH 8.0) was added to 4 mg of KLH and incubated with stirring at room temperature for 2 h. Unreacted 2-iminothiolane was removed by

Sephadex G15 column equilibrated previously with 0.1 M sodium phosphate buffer pH 7.2 containing 5 mM EDTA and eluted with the same buffer. Fractions positive for KLH with BioRad protein assay dye reagent were combined. A small portion was used to estimate sulfhydryl groups in the thiolated KLH using Ellman's reagents and cysteine as standard as described earlier (Riddles PW, Blackeley RL, Zerner B Ellman's reagent: 5,5'-dithiobis(2-nitrobenzoic acid)--a reexamination, *Anal Biochem* 94: 75-81, 1979). The KLH was estimated by a dye method using BioRad dye reagent according to the manufacture's instructions.

[0206]            *Conjugation of FucGM1-MMCCH to thiolated KLH*

[0207]            The FucGM1-MMCCH product and thiolated KLH were mixed and adjusted to pH 7.2 with 0.1M sodium phosphate buffer pH 8.0. The reaction mixture was then incubated at room temperature overnight. The content of the FucGM1-MMCCH-KLH reaction vial was transferred to a Centriprep concentrator 30 (Amicon: molecular cut-off 30000 Dalton) and unreacted FucGM1-MMCCH was removed completely with multiple washes. The conjugate was checked by HPTLC for the absence of unreacted FucGM1 as mentioned above. The epitope ratios of two batches of conjugate were determined by estimating protein content by BioRad dye binding protein assay and carbohydrate by a HPAEC-PAD assay. The epitope ratio of FucGM1-KLH (by direct method) and FucGM1-MMCCH-KLH was 149/1 and 1527/1 respectively.

[0208]            *B. Example 2: Synthesis of Globo-H and conjugates thereof:*

[0209]            *1) Discussion of Synthesis:*

[0210]            In yet another embodiment of the present invention, an improved synthesis of Globo-H is provided utilizing the novel synthetic methodology as presented herein. The previous synthesis of globo-H described by the present inventors (Park *et al. J. Am. Chem. Soc.* **1996**, *118*, 11488; Bilodeau *et al. J. Am. Chem. Soc.* **1995**, *117*, 7840; Kim *et al. J. Org. Chem.* **1995**, *60*, 7716) utilized all glycal building blocks (Danishefsky *et al. Angew. Chem.* **1996**, *108*, 1482; *Angew. Chem. Int. Ed. Engl.* **1996**, *35*, 1380) for the rapid construction this complex oligosaccharide. These investigations relied on a highly convergent [3+3] coupling to generate the hexasaccharide core contained in the final target. In this approach, a flexible terminal glycal was maintained throughout the hexasaccharide construction. The glycal was then used to install the ceramide side chain present en route to globo-H glycolipid **16a** or its allyl glycoside **16b**. The synthesis of **16a** served to facilitate the proof of structure and immunocharacterization of globo-H. The allyl glycoside **16b** was employed for immunoconjugation to biocarrier proteins. The previous protocols were effective in producing *adequate* quantities of synthetic material for proof of structure, immunocharacterization, conjugation, mouse vaccinations and phase I human clinical trials. However, improved synthetic methodologies were

desired to allow for efficient bioconjugation and also to provide suitable material for clinical purposes.

**[0211]** Difficulties associated with the allyl glycoside approach invited an alternative solution which, in general terms, is described herein, and is more specifically described for fucosyl GM1 above, and additionally for Globo-H below (Figure 7). Thus, it was conceived that a hexasaccharide could be constructed containing a glycoside that would enable linkage to carrier protein, already in place (see Figure 8). Indeed this group would already have been incorporated at the reducing end of the acceptor in the [3+3] coupling step. For successful implementation of this significant new variation of the globo-H synthesis (and other complex tumor associated antigens), it would be preferable that 1) the trisaccharide acceptor containing the glycoside construct would be readily synthesizable; 2) the glycoside construct would be compatible with the [3+3] coupling; 3) the construct, in contrast to the allyl glycoside, would survive global deprotection; and 4) efficient conjugation would be implementable.

**[0212]** An initial retrosynthetic analysis is shown in Figure 9. For maximum convergency, the ABC acceptor was envisioned containing the aforesaid pentenyl glycosidic linker. Additionally, the same DEF trisaccharide donor sector would be utilized as described previously. The hexasaccharide core would then be assembled via a convergent [3+3] ABC+DEF coupling reaction using a sulfonamido glycosidation protocol (Griffith *et al. J. Am. Chem. Soc.* **1990**, *112*, 5811; Griffith *et al. J. Am. Chem. Soc.* **1991**, *113*, 5863). Previous results had indicated that the presence of a free hydroxyl at C4 of the reducing end galactose (Figure 9, see asterisk) in the DEF donor would be necessary to direct the formation of the required  $\beta$ -linkage in the sulfonamido glycosidation (Park *et al. J. Am. Chem. Soc.* **1996**, *118*, 11488; Kwon *et al. J. Am. Chem. Soc.* **1998**, *120*, 1588). The sequencing of the [3+3] coupling was expected to take place as shown, owing to the higher reactivity of the equatorial C3 hydroxyl group (see bold) in the acceptor as compared to the necessary axial C4 hydroxyl group in the donor trisaccharide. Important to the strategy described herein is that, once the hexasaccharide is assembled, only protecting group manipulations would be required to reach the pro-vaccine antigen.

[0213] In general, the synthesis of the DEF trisaccharide sector is fairly concise, requiring six transformations starting from 6-*O*-TIPS galactal and tri-*O*-benzyl fluoro fucose (Park *et al. J. Am. Chem. Soc.* **1996**, *118*, 11488; Bilodeau *et al. J. Am. Chem. Soc.* **1995**, *117*, 7840; Kim *et al. J. Org. Chem.* **1995**, *60*, 7716). For purposes of a second-generation approach, the acceptor trisaccharide component can be dissected into a lactose derivative containing the desired NPG bearing a differentiated hydroxyl at C4' and an appropriate C-ring donor (Figure 9). The galactose donor monosaccharide also requires differential protection at C3, for eventual ABC+DEF coupling, and needs careful attention to efficiently allow for the required  $\beta$ -glycosidic linkage joining the AB+C domains.

[0214] As shown in Figure 10, the synthesis of the requisite ABC acceptor was conducted taking advantage of readily available lactose octaacetate, **17**. Conversion of **17** to the known  $\alpha$ -bromo donor **18** (Reithal, Y. *J. Am. Chem. Soc.* **1952**, *74*, 4210; Dasgupte *et al. Carbohydr. Res.* **1994**, *264*, 155) was followed by silver carbonate mediated glycosylation with pentenyl alcohol as acceptor, to give **19** (Pent = CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH=CH<sub>2</sub>) in 75% yield on a 100 g scale (Rodriguez *et al. Aust. J. Chem.* **1990**, *43*, 665). Similar processing of **18** with silver triflate as promoter resulted in 17% yield of the desired product. Thus, with the formation of **19**, in an early stage of the synthesis, the linker was successfully installed to be used for late stage bioconjugation.

[0215] Subsequent steps were designed to generate a free acceptor site at C4' of **19** for an eventual AB + C coupling give the ABC trisaccharide (Figure 10). Removal of the ester protecting groups in **19** to give a pentenyl lactoside was followed by a stannane mediated monobenylation to selectively give the C3' benzyl ether (David *et al. J. Chem. Soc. Perkin Trans. I* **1981**, 1797; Maranduba *et al. Carbohydr. Res.* **1986**, *151*, 105). In a second step, the C4' and C6' hydroxyls were engaged as a benzylidene acetal to provide compound **20** as the only observable product (Jansson *et al. J. Org. Chem.* **1998**, *53*, 5629; Koeman *et al. Tetrahedron* **1993**, *49*, 5291; Qiu *et al. Liebigs Ann.* **1992**, 217). Finally, perbenzylation of the remaining hydroxyl groups in **20** and regioselective reductive cleavage of the benzylidene with sodium cyanoborohydride and anhydrous HCl gave the C4' alcohol **21** (Garegg, P.J. *Pure Appl. Chem.* **1984**, *56*, 845). Thus, starting from

lactose octaacetate **17**, the AB pentenyl glycoside acceptor **21** was obtained in 7 steps and in 20% overall yield.

[0216] With large quantities of the protected pentenyl glycoside **21** available, attention was turned to the AB+C coupling to form the trisaccharide acceptor **24**. The previous synthesis of glycal **27** (Figure 10) required careful preparation of the highly activated  $\beta$ -fluoro donor **23** from glycal **22**. The C3 PMB ether contained in **22** was strategically incorporated to allow for eventual ABC+DEF coupling upon selective deprotection of this group. In the course of this work, it was discovered that  $\alpha$ -**23** could be formed conveniently in high yield and on large scale. Accordingly,  $\alpha$ -donor **23** was prepared from differentially protected glycal **22** by epoxidation, exposure to HF:pyridine to yield the *cis* fluoro-hydrin derivative and subsequent conversion of the resulting C2-hydroxyl to its benzyl ether. The anomeric  $\alpha$ : $\beta$  selectivity was demonstrated to be 10:1 and the overall yield in transforming **22** into **23** was 76%.

[0217] The effectiveness of the AB+C coupling using previously prepared  $\beta$ -**23** and the newly prepared  $\alpha$ -**23** with the AB acceptor **21** was then investigated. The synthetic optimization of glycal trisaccharide **27** as a model case (see **23**+**26**->**27**) was also examined because of its presumed sensitivity to overly demanding coupling promoters. In these investigations it was discovered that the reduced reactivity of  $\alpha$ -fluoro donors could be attenuated by conducting the couplings with highly fluorophilic promoters in judiciously chosen solvents, as summarized in Table 1. The previous coupling procedure using the predominantly  $\beta$ -fluoro donor **23** and glycal **26** to give glycal trisaccharide **27** employed Miyakiyama coupling conditions (Mukaiyama *et al. Chem. Lett.* **1981**, 431; Nicolaou *et al. J. Am. Chem. Soc.* **1990**, *112*, 3693; Nicolaou *et al. J. Chem. Soc. Chem. Commun.* **1991**, 870) and proceeded in 54% yield with modest anomeric selectivity (entry 1, Table 1). Investigations using other promoters with  $\alpha$ -**23** are shown in entries 2 and 3, but produced little satisfaction in terms of overall efficiency. However, the preparation of glycal **27** was successfully extended to include the described  $\alpha$ -donor **23** using strongly fluorophilic  $\text{Cp}_2\text{Zr}(\text{OTf})_2$  promotion (73% yield, entry 4). Gratifyingly, these optimized glycosidation conditions for formation of **27** were successfully applied to

the AB+C coupling employing pentenyl glycoside **21** to provide trisaccharide **24** in yields that rivaled the parent reaction (80% yield, entry 6). Murykiyama coupling of  $\beta$ -**23** with **21** yielded 42% of trisaccharide **24** (entry 5). Satisfied with the events leading to smooth formation of large quantities of **24**, the [3+3] coupling would be investigated. The discharge of the lone PMB group in **24** could be effected in excellent yield (92%), thus completing the assembly of the desired ABC pentenyl acceptor **25**.

[0218] **Table 1.** Coupling conditions used to generate the ABC trisaccharide.

	Acceptor AB	Donor C	Promoter, Solvent	$\alpha : \beta$ selectivity	Yield, Product

(a: see Park *et al. J. Am. Chem. Soc.* 1996, 118, 11488; Bilodeau *et al. J. Am. Chem. Soc.* 1995, 117, 7840; Kim *et al. J. Org. Chem.* 1995, 60, 7716).

[0219] The key step and final transformations completing the synthesis of **16c** are shown in Figure 11. Treatment of the known DEF donor **28** (see Figure 10) with MeOTf (Lönn, H. *Carbohydr. Res.* **1985**, 134, 105; Lönn, H. *J. Carbohydr. Chem.* **1987**, 6, 301) In the presence of acceptor **25** smoothly provided hexasaccharide **29** in 60% yield. The configuration of the new anomeric center of **29** was confirmed to be  $\beta$ -configured. The [3+3] coupling yield using trisaccharide acceptor **25** was comparable to the [3+3] procedure using the glycal-based acceptor corresponding to **27**. The tremendous advantage of using **15**, however, is manifested in the steps which follow.

[0220] Global deprotection began with subjection of **29** to TBAF in order to remove the silyl ethers and the cyclic carbonate. The benzyl and sulfonamido protecting groups on the resulting penta-ol were then cleaved under the action of

dissolving metal reduction. This protocol was followed by peracetylation to give the isolable hexasaccharide peracetate **30**. As in earlier steps, the pentenyl linkage proved highly reliable under the listed deprotection conditions. It is again notable by contrast that the corresponding allyl glycoside (to ultimately yield **16b**) is not stable to the reducing metal conditions required for global deprotection and therefore must be installed subsequent to deprotection. Deacetylation of **30** with methoxide yielded the fully deprotected pentenyl glycoside of globo-H, **16c**, notably poised for bioconjugation. *Importantly, in the second generation variation, progress toward 16d from hexasaccharide construct 29 was greatly simplified because the need for additional functionalization to allow for conjugation is eliminated.*

[0221]        Toward the goal of facilitating clinical evaluation of synthetic globo-H, **16c** has been conjugated to carrier protein KLH for purposes of creating a functional vaccine. The first step of this procedure involved ozonolysis of the pendant olefin, followed by reductive work-up, to give the uncharacterized aldehyde intermediate **31**, as shown in Figure 12. Reductive amination with KLH and sodium cyanoborohydride in phosphate buffer yielded vaccine glycoconjugate **16d** ( $n = 3$ ). Covalent attachment of the carbohydrate to the proteins presumably occurs through the  $\epsilon$ -amino groups on exposed lysine residues in KLH. Hydrolytic carbohydrate analysis of **16d** revealed approximately 350 carbohydrate residues per molecule of carrier protein.

[0222]                    **2) Experimentals:**

[0223]        **Peracetyl pentenyl- $\beta$ -D-lactoside (19).** To a cooled (ice bath) suspension of lactose octaacetate (100.0 g, 147.7 mmol), glacial acetic acid (30 mL) and acetic anhydride (30 mL) was added 100 mL of 30% HBr in AcOH dropwise over a period of 60 minutes. The reaction mixture stirred for 1 hour and the ice bath was removed. Upon stirring for an additional 2 hours at room temperature, the mixture became a homogeneous yellow solution. The solution was diluted with H<sub>2</sub>O (1000 mL) and extracted with CHCl<sub>3</sub> (3x400 mL). The organic extracts were washed with H<sub>2</sub>O (2x1000 mL), satd. NaHCO<sub>3</sub> (3x500 mL), dried over MgSO<sub>4</sub> and concentrated. The product was azeotroped with anhydrous benzene and dried under

high vacuum to yield 98.8 g (96%) of the lactosyl bromide which was used without further purification.

**[0224]** To a suspension of  $\text{Ag}_2\text{CO}_3$  (100 g, 362.6 mmol), freshly activated molecular sieves (15 g) and a crystal of  $\text{I}_2$  in 400 mL  $\text{CH}_2\text{Cl}_2$  was added pentenyl alcohol (5.0 equiv., 73.4 mL) and then the lactosyl bromide (98.8 g, 141.4 mmol) in 400 mL of  $\text{CH}_2\text{Cl}_2$ . After stirring in the dark at room temperature for 16 hours, the reaction was filtered through a plug of Celite with additional  $\text{CH}_2\text{Cl}_2$  and concentrated to a yellow oil which was purified by flash column chromatography (10% EtOAc/hexanes→50% EtOAc/hexanes) to yield 74.7 g (75%) of the pentenyl lactoside as a white foam.  $[\alpha]_{22}^D -48.9^\circ$  ( $c$  7.5,  $\text{CHCl}_3$ ); IR (film  $\text{CHCl}_3$ ) 2941, 1751, 1369, 1224, 1054  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz)  $\delta$  5.60 (m, 1H), 5.17 (d, 1H,  $J=2.7$  Hz), 5.02 (m, 1H), 4.93 (dd, 1H,  $J=7.9, 10.3$  Hz), 4.85 (d, 1H,  $J=1.6$  Hz), 4.78 (m, 2H), 4.71 (dd, 1H,  $J=9.6, 7.9$  Hz), 4.30 (m, 3H), 3.93 (m, 3H), 3.66 (m, 3H), 3.45 (m, 1H), 3.30 (m, 1H), 1.98 (s, 3H), 1.94 (s, 3H), 1.91 (m, 2H), 1.89 (s, 3H), 1.88 (s, 6H,  $2\times\text{CH}_3$ ), 1.87 (s, 3H), 1.79 (s, 3H), 1.49 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 100 MHz)  $\delta$  170.33, 170.28, 170.09, 170.00, 169.74, 69.54, 169.01, 137.72, 115.00, 101.01, 100.51, 76.27, 72.76, 72.48, 71.64, 70.94, 70.58, 69.23, 69.01, 66.52, 61.97, 60.73, 29.75, 28.49, 20.80, 20.75, 20.64, 20.57, 20.45. **[0225]** **Pent-4-enyl 3'-O-benzyl-4', 6'-O-benzylidenyl- $\beta$ -D-lactoside (20).** Peracetylated pentenyl lactoside, **8**, (18.2 g, 25.8 mmol) was dissolved in 300 mL of anhydrous MeOH and 2.0 mL of NaOMe (25% in MeOH) was added. The reaction stirred at rt for 16 hours and was neutralized with Dowex- $\text{H}^+$  (pH 5-6). The reaction was filtered with additional MeOH and concentrated to a white solid, **19a**, (10.6 g, quantitative) which was used without further purification:  $^1\text{H}$  NMR ( $\text{D}_2\text{O}$ , 400 MHz)  $\delta$  5.81 (m, 1H), 5.00 (dd, 1H,  $J=17.3, 1.9$  Hz), 4.92 (dd, 1H,  $J=8.9$  Hz), 4.74 (m, 1H), 4.39 (d, 1H,  $J=8.0$  Hz), 4.35 (d, 1H,  $J=7.8$  Hz), 3.72-3.42 (m, 12H), 3.21 (m, 1H), 2.06 (m, 2H), 1.63 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{D}_2\text{O}$ , 100 MHz)  $\delta$  141.27, 117.31, 105.42, 104.54, 80.85, 77.84, 77.24, 76.92, 75.33, 75.00, 73.44, 72.47, 71.03, 63.52, 62.56, 31.83, 30.48.

The hepta-ol **19a** (1.14 g, 2.8 mmol) and dibutyltin oxide (0.76 g, 3.1 mmol) were heated at reflux in benzene (70 mL) with azeotropic water removal for 15 h. The

mixture was doubled in concentration, cooled to room temperature, and benzyl bromide (0.69 ml, 5.8 mmol) and  $\text{Bu}_4\text{NI}$  (1.03 g, 2.8 mmol) were added. The mixture was heated at reflux 3.5 h, cooled, silica gel was added to the flask, and the solvent was evaporated. The residue was applied to a column of silica gel, tin by-products were removed by flushing with hexanes, and elution (5 % MeOH in  $\text{CH}_2\text{Cl}_2$ ) gave the pure 3'-O-benzyl ether (0.76 g, 54 %) as a white foam:  $[\alpha]_{22}^D +36.7^\circ$  (*c* 2.73,  $\text{CHCl}_3$ ); IR (film  $\text{CHCl}_3$ ) 3371, 2924, 2880, 1372, 1157, 1074  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR ( $\text{MeOH}-d_4$ , 400 MHz)  $\delta$  7.46-7.40 (m, 2H), 7.35-7.20 (m, 3H), 5.92-5.72 (m, 1H), 5.08-4.93 (m, 2H), 4.76 (d, 1H, *J*=11.8 Hz), 4.65 (d, 1H, *J*=11.8 Hz), 4.38 (d, 1H, *J*=7.8 Hz), 4.28 (d, 1H, *J*=7.8 Hz), 4.02 (d, 1H, *J*=2.9 Hz), 3.95-3.63 (m, 6H), 3.61-3.48 (m, 4H), 3.43-3.20 (m, 3H), 2.20-2.10 (m, 2H), 1.78-1.65 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{MeOH}-d_4$ , 100 MHz)  $\delta$  139.77, 139.47, 129.29, 129.08, 128.64, 115.19, 105.02, 104.23, 82.17, 80.74, 76.88, 76.40, 76.35, 74.71, 72.55, 71.81, 70.23, 67.02, 62.44, 61.91, 31.22, 30.07. FAB-HRMS calc'd for  $\text{C}_{24}\text{H}_{36}\text{O}_{11}\text{Na}^+$ ; 523.2155. Found; 523.2137.

**[0226]** The 3'-O-benzyl ether (0.6 g, 1.20 mmol) was dissolved in acetonitrile and DMF (5:2, 7 mL), and benzaldehyde dimethylacetal (0.47 mL, 3.1 mmol) and CSA (14 mg, 60  $\mu\text{mol}$ ) were added. After stirring 16 h at room temperature, the mixture was diluted with  $\text{CH}_2\text{Cl}_2$  and washed with sat.  $\text{NaHCO}_3$ . The organic extracts were dried ( $\text{MgSO}_4$ ), evaporated, and following addition of ether (100 mL) to the resulting residue, the pure **20** was recovered by filtration (0.51 g, 72 %):  $[\alpha]_{22}^D +111^\circ$  (*c* 2.21, MeOH); IR ( $\text{CHCl}_3$  film) 3440, 2872, 1368, 1163, 1109, 1048, 1005  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR ( $\text{MeOH}-d_4$ , 400 MHz)  $\delta$  7.55-7.11 (m, 10H), 5.82-5.69 (m, 1H), 5.45 (s, 1H), 4.98-4.83 (m, 2H), 4.64 (d, 2H, *J*=3.0 Hz), 4.40 (d, 1H, *J*=7.9 Hz), 4.23 (d, 1H, *J*=3.4 Hz), 4.18 (d, 1H, *J*=7.8 Hz), 4.15-3.98 (m, 2H), 3.87-3.66 (m, 4H), 3.55-3.10 (m, 7H), 2.20-2.10 (m, 2H), 1.65-1.53 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{MeOH}-d_4$ , 100 MHz)  $\delta$  139.76, 139.49, 139.47, 129.86, 129.30, 129.07, 129.03, 128.72, 127.35, 115.19, 104.69, 104.28, 102.03, 80.63, 80.17, 76.37, 76.28, 74.77, 74.73, 72.84, 70.86, 70.25, 68.17, 61.70, 31.22, 30.07. **[0228]** The benzylidene (0.63 g, 0.66 mmol) was dissolved in THF (6.6 mL) and stirred with freshly activated 4ÅMS (0.25 g) 10 min at room temperature. In one portion NaCNBH<sub>3</sub> (0.21 g, 3.3 mmol) was added followed by anhydrous HCl (2.0 M Et<sub>2</sub>O), dropwise until the mixture no longer bubbled (approx. 2 mL). After stirring and additional 10 min, the mixture was passed through a plug of Celite washing with ethyl acetate, the filtrate was washed with sat. NaHCO<sub>3</sub> and brine, dried (MgSO<sub>4</sub>) and the organic layers evaporated. Purification by column chromatography (9:1 hexanes:ethyl acetate) gave pure **21** as white solid (0.49 g, 79 %):  $[\alpha]_{22}^D +200^\circ$  (*c* 1.05, CHCl<sub>3</sub>); IR (CHCl<sub>3</sub> film) 3474, 3062, 3029, 2869, 1453, 1364, 1094, 1028 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.40-7.06 (m, 30H), 5.80-5.66 (m, 1H), 5.02-4.85 (m, 3H), 4.81 (d, 1H, *J*=11.0 Hz), 4.75-4.54 (m, 6H), 4.67 (d, 1H, *J*=12.2 Hz), 4.42-4.26 (m, 5H), 3.94 (s, 1H), 3.92-3.81 (m, 2H), 3.71 (dd, 1H, *J*=10.7 Hz, 4.1 Hz), 3.64 (d, 1H, *J*=10.6 Hz), 3.57 (dd, 1H, *J*=9.4 Hz, 5.5 Hz), 3.55-3.42 (m, 3H), 3.38 (dd, 1H, *J*=5.2 Hz, 9.6 Hz), 3.36-3.21 (m, 4H), 2.32 (s, 1H),

2.15-2.02 (m, 2H), 1.74-1.60 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 100 MHz)  $\delta$  139.04, 138.54, 138.52, 138.23, 138.09, 137.96, 137.81, 128.33, 128.15, 127.93, 127.66, 127.50, 114.80, 103.50, 102.43, 82.79, 81.68, 80.99, 79.27, 76.52, 75.22, 75.10, 74.99, 74.83, 73.37, 72.99, 72.67, 71.86, 69.10, 68.32, 68.16, 66.00, 30.11, 28.83. FAB-HRMS calc'd for  $\text{C}_{59}\text{H}_{66}\text{O}_{11}\text{Na}^+$ ; 973.4503. Found; 973.4513.

**[0229]  $\alpha$ -Fluoro donor (23).** A solution of 3-*O*-PMB-4,6-Di-*O*-benzyl-galactal (2.24 g, 5.02 mmol) in dry  $\text{CH}_2\text{Cl}_2$  (5 ml) under  $\text{N}_2$  at  $0^\circ\text{C}$  was treated with dimethyldioxirane (0.11 M, 47 ml), and the mixture was stirred until all of the glycal was consumed ( $\sim 1\text{h}$ , TLC 30% EtOAc in hexane) Note: *Elevated temperature and/or excess of DMDO will prompt oxidation of the PMB group and lower reaction yield.* The solvents were evaporated under vacuum at  $0^\circ\text{C}$  and the residue was kept under high vacuum. The flask containing galactal epoxide was charged with freshly prepared 4 A molecular sieves (2 g), dry THF (50 ml) and cooled to  $0^\circ\text{C}$ . HF/Pyr complex (0.79 ml,  $\sim 5$  equiv.) was added dropwise via syringe. The reaction mixture was left overnight to slowly reach room temperature and quenched with  $\text{Et}_3\text{N}$  (1.27 g,  $\sim 2.5$  equiv.) to reach pH  $\sim 7$ . The mixture was filtered through a pad of anhydrous  $\text{MgSO}_4$  and rinsed three times with 50 ml of EtOAc. The filtrate was washed with water (50 ml) and saturated  $\text{NaHCO}_3$  solution (50 ml), dried over  $\text{MgSO}_4$  and concentrated to dryness. Flash column chromatography (EtOAc/hexanes, 2/1) gave 2.06 g (85% yield) of fluorohydrin as a mixture of anomers  $\alpha:\beta = 10 : 1$ .  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ , 376 MHz,  $\text{C}_6\text{F}_6$  as external standard)  $\delta$  9.7 (dd,  $\alpha$ ,  $J = 54.4, 25.0$  Hz) 20.0 (dd,  $\beta$ ,  $J = 53.9, 13.1$  Hz);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz)  $\delta$  7.38 – 7.24 (m, 12H), 6.90 (d, 2H,  $J = 8.7$  Hz), 5.70 (dd, 1H,  $J = 54.4, 2.8$  Hz), 4.89 and 4.57 (two d, 2H,  $J = 11.3$  Hz), 4.70 and 4.54 (AB q, 2H,  $J = 11.2$  Hz), 4.54 and 4.46 (AB q, 2H,  $J = 11.8$  Hz), 4.17 (AMX octet, 1H,  $J = 2.8, 10.1, 25.0$  Hz), 4.13 (br t, 1H,  $J = 6.8$  Hz), 4.06 (d, 1H,  $J = 1.5$  Hz), 3.81 (s, 3H), 3.74 (dd, 1H,  $J = 2.6, 10.1$  Hz), 3.60 (m, 2H).

**[0230]** The above mixture (8.29 g, 17.2 mmol) was dissolved in dry DMF (100 ml) containing freshly prepared 4 A molecular sieves (3 g) under  $\text{N}_2$  at  $0^\circ\text{C}$ , treated with benzyl bromide (4.41 g, 25.8 mmol, 1.5 equiv.) and finally with NaH (1.24 g, 60% dispersion in oil, 30.86 mmol, 1.8 equiv.), and stirred overnight at room

temperature. The reaction was quenched with glacial acetic acid (0.93 g, 0.9 equiv.) and the mixture filtered through a pad of anhydrous  $\text{MgSO}_4$  with EtOAc (4x50 ml). The organic solution was washed with water (4 x 50 ml), dried ( $\text{MgSO}_4$ ) and concentrated *in vacuo*. Flash column chromatography of the residue (hexane/EtOAc, 4/1) gave 9.36 g (95%) of the title compound as colorless liquid with the same ratio of anomers  $\alpha : \beta = 10 : 1$  as the starting fluorohydrin.  $^{19}\text{F}$  NMR ( $\text{CDCl}_3$ , 376 MHz,  $\text{C}_6\text{F}_6$  as external standard)  $\delta$  11.5 (dd,  $\alpha$ ,  $J = 53.7, 25.2$  Hz), 22.8 (dd,  $\beta$ ,  $J = 53.4, 13.0$  Hz). For analytical purpose 50 mg of pure  $\alpha$  anomer was obtained using preparative HPLC.  $[\alpha]_{22}^D - 54.5^\circ$  ( $c$  0.55,  $\text{CHCl}_3$ );  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 500 MHz),  $\delta$  7.38–7.24 (m, 17H), 6.88 (d, 2H,  $J=8.6$  Hz), 5.58 (dd, 1H,  $J=53.7, 2.7$  Hz), 4.93 (d, 2H,  $J=11.34$  Hz), 4.56 (d, 2H,  $J=11.34$  Hz), 4.85 (AB q, 2H,  $J = 11.78$  Hz), 4.72 (AB q, 2H,  $J = 11.78$  Hz), 4.73 (AB q, 2H,  $J = 11.3$  Hz), 4.68 (AB q, 2H,  $J = 11.3$  Hz), 4.47 (AB q, 2H,  $J = 11.84$  Hz), 4.41 (AB q, 2H,  $J = 11.84$  Hz), 4.09 (br t, 1H,  $J = 6.5$  Hz), 4.02 (AMX m, 1H,  $J = 2.7, 10.05, 25.2$  Hz), 3.98 (app s, 1H), 3.92 (dd, 1H,  $J = 2.64, 10.05$  Hz), 3.81 (s, 3H), 3.54 and 3.52 (ABX m, 2H,  $J=9.3, 6.05, 7.0$  Hz);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 125MHz)  $\delta$  159.20, 138.35, 138.08, 137.71, 130.43, 129.18, 128.39, 128.25, 128.14, 127.92, 127.8, 127.78, 127.66, 113.81, 106.25 (d,  $J = 229.0$  Hz), 78.09, 75.65 (d,  $J = 23.5$  Hz), 74.79 ( $\text{ArCH}_2$ ), 74.29, 73.70 ( $\text{ArCH}_2$ ), 73.45 ( $\text{ArCH}_2$ ), 72.71 ( $\text{ArCH}_2$ ), 71.70 (d,  $J = 2.7$  Hz) 68.26, 55.24 ( $\text{CH}_3\text{O}$ ); MS ( $\text{NH}_3$ ) 586 ( $[\text{M} + \text{NH}_4]^+$ ).

**[0231] PMB trisaccharide (24).** A mixture of lactoside (**21**) (402 mg, 0.423 mmol) and fluoro donor (**23**) (485 mg, 0.846 mmol, 2 equiv.) was azeotroped with anhydrous benzene (3x10 ml) and further dried on high vacuum for 3 h. The above mixture was dissolved in toluene (3.8 ml) and transferred via cannula to a flask containing freshly prepared 4 Å molecular sieves (0.68 g) under  $\text{N}_2$ , treated with 2,6-di-tert-butylpyridine (143  $\mu\text{l}$ ) and cooled to  $-20^\circ\text{C}$ .  $(\text{Cp})_2\text{Zr}(\text{OTf})_2$  (225 mg, 0.381 mmol, 0.9 equiv.) was suspended in THF (0.38 ml) and added via a cannula to the reaction mixture. The reaction was stirred for 72 h at  $7^\circ\text{C}$  in darkness. The reaction mixture was diluted with EtOAc (10 ml) and filtered through a pad of anhydrous  $\text{MgSO}_4$  with EtOAc (3x 10mL). The filtrate was washed with satd.  $\text{NaHCO}_3$  solution (2 x 10 ml), dried over  $\text{MgSO}_4$ , and concentrated to dryness. Flash column chromatography (2%  $\text{Et}_2\text{O}/\text{CH}_2\text{Cl}_2$ ) gave 509 mg (80%) of desired  $\alpha$ -product (**24**)

and 51 mg (8%) of  $\beta$ -product.  $[\alpha]_{22}^D +24.6^\circ$  ( $c$  3.90,  $\text{CHCl}_3$ ); IR ( $\text{CHCl}_3$  film) 3062, 3029, 2919, 2868, 1612, 1513, 1496, 1364, 1303, 1248, 1028  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz)  $\delta$  7.40-6.95 (m, 49 H), 6.69 (d, 1H,  $J=8.5$  Hz), 5.73 (m, 1H), 5.00-4.93 (m, 2H), 4.92-4.84 (m, 2H), 4.82-4.73 (m, 2H), 4.72-4.63 (m, 5H), 4.61 (d, 1H,  $J=13.0$  Hz), 4.48-4.35 (m, 5H), 4.34-4.24 (m, 4H), 4.16 (d, 2H,  $J=6.8$  Hz), 4.07 (dd, 1H,  $J=8.8$  Hz), 4.02-3.80 (m, 8H), 3.78-3.60 (m, 3H), 3.68 (s, 3H), 3.60-3.35 (m, 6H), 3.35-3.18 (m, 4H), 3.12-3.04 (m, 1H), 2.06 (m, 2H), 1.65 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 100 MHz)  $\delta$  158.76, 139.66, 139.45, 139.26, 139.16, 139.09, 138.92, 138.57, 138.52, 131.39, 129.30, 128.95, 128.70, 128.60, 129.30, 128.08, 127.95, 115.35, 114.02, 104.05, 103.35, 101.25, 83.14, 82.17, 79.91, 79.71, 77.77, 77.04, 75.69, 75.58, 75.46, 75.33, 74.17, 73.75, 73.54, 73.48, 72.65, 72.54, 69.91, 69.71, 68.80, 68.33, 68.19, 55.11, 30.14, 28.86; FAB-HRMS calc'd for  $\text{C}_{94}\text{H}_{102}\text{O}_{17}\text{Na}^+$ ; 1525.7014. Found; 1525.6996.

**[0232] Trisaccharide acceptor (25).** A solution of PMB trisaccharide (**24**) (445 mg, 0.296 mmol) in methylene chloride (10 ml) at 0  $^\circ\text{C}$  was treated with phosphate buffer (1.5 ml, pH = 7.4) and DDQ (89 mg, 1.3 equiv.) and stirred at 0  $^\circ\text{C}$  for 5 h. The reaction mixture was diluted with EtOAc (50 ml), washed with satd.  $\text{NaHCO}_3$  solution (2 x 20 ml) and water (20 ml), dried over  $\text{MgSO}_4$ , and concentrated to dryness. The crude material was purified by flash column chromatography (4% ether in methylene chloride) to give 344 mg (84%) of deprotected trisaccharide (**25**) as a colorless oil.  $[\alpha]_{22}^D +28.2^\circ$  ( $c$  5.70,  $\text{CHCl}_3$ ); IR ( $\text{CHCl}_3$  film) 3570, 3062, 3029, 2913, 2868, 1496, 1453, 1364, 1208, 1095  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz)  $\delta$  7.77-7.06 (m, 45H), 5.73 (m, 1H), 5.01 (dd, 1H,  $J=5.5$ , 3.3 Hz), 4.95 (dd, 1H,  $J=5.8$ , 2.6 Hz), 4.90 (m, 1H), 4.78 (d, 1H,  $J=10.9$  Hz), 4.75 (d, 1H,  $J=11.4$  Hz), 4.70-4.59 (6d, 6H), 4.47-4.37 (m, 5H), 4.28 (m, 3H), 4.19 (s, 2H), 4.08-3.91 (m, 6H), 3.85 (m, 2H), 3.69 (m, 5H), 3.66 (1H, d,  $J=11.0$  Hz), 3.50-3.19 (m, 9H), 3.10 (dd, 1H), 2.07 (m, 2H), 1.79 (d, 1H, OH), 1.65 (d, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 100 MHz)  $\delta$  139.36, 138.72, 138.63, 138.52, 138.41, 138.29, 138.19, 138.07, 137.98, 128.35, 128.20, 128.06, 127.97, 127.66, 127.54, 127.08, 114.82, 103.55, 102.67, 99.58, 82.93, 81.67, 81.55, 79.32, 77.61, 76.90, 75.13, 75.02, 74.96, 74.80, 73.08, 72.99, 72.91, 72.01, 69.95, 69.22, 69.15, 68.34, 67.73, 67.57, 60.35, 30.19, 28.92; FAB-HRMS calc'd for  $\text{C}_{86}\text{H}_{94}\text{O}_{16}\text{Na}^+$ ; 1405.6439. **[0233] Hexasaccharide (29).** The thioethyl donor **28** (543 mg, 0.425 mmol) and acceptor **25** (587 mg, 0.425 mmol) were combined, azeotroped with anhydrous benzene (5x5 mL) and placed under high vacuum for 5 hours. The mixture was then dissolved in 3.5 mL CH<sub>2</sub>Cl<sub>2</sub> and 7.0 mL Et<sub>2</sub>O, treated with freshly prepared molecular sieves and cooled to 0 °C. Methyl triflate (3.0 equiv., 144 µL) was added in one portion and the reaction stirred at 0 °C for 3 hours. Another 144 µL of MeOTf was added and the reaction was allowed to stir for an additional 2 hours at 5 °C. The reaction was quenched by the addition of solid NaHCO<sub>3</sub>, filtered through Celite with EtOAc, concentrated and purified by HPLC (17% EtOAc/hexanes) to give 663 mg (60%) of hexasaccharide as a white foam.  $[\alpha]_{22}^D -9.7^\circ$  (*c* 1.00, CHCl<sub>3</sub>); IR (CHCl<sub>3</sub> film) 3533, 3343, 3087, 3030, 2940, 2865, 1790, 1496, 1453, 133, 1095 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ 7.76 (d, 2H, J=7.5 Hz), 7.45-7.00 (m, 63H), 5.84 (m, 1H), 5.20 (s, 1H), 5.11 (d, 1H, J=3.2 Hz), 5.09 (d, 1H, J=3.6 Hz), 5.05 (d, 1H, J=3.3 Hz), 5.03 (m, 1H), 4.92 (m, 2H), 4.86 (d, 1H, J=6.0 Hz), 4.82 (m, 2H), 4.78 (1H, d, J=2.2 Hz), 4.74-4.61 (m, 8H), 4.53-4.44 (4d, 4H), 4.38-4.30 (m, 4H), 4.18-3.82 (m, 20H), 3.76-3.66 (m, 5H), 3.66-3.60 (m, 2H), 3.58-3.52 (m, 2H), 3.48-3.40 (m, 2H), 3.38-3.32 (m, 2H), 3.29-3.25 (m, 3H), 3.06 (dd, 1H, J=10.2 Hz), 2.86 (s, 1H), 2.74 (m, 1H), 2.16 (m, 2H), 1.74 (m, 2H), 1.23 (s, 3H, J=6.5 Hz), 1.16-1.07 (m, 42H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz) δ 155.49, 140.71, 139.37, 138.96, 138.72, 137.70, 138.66, 138.55, 138.42, 138.37, 138.10, 138.07, 138.04, 137.88, 132.07, 128.89, 128.64, 128.50, 128.27, 128.16, 128.04, 127.86, 127.68, 127.53, 127.34, 127.20, 114.79, 103.49, 103.14, 102.61, 99.63, 99.12, 97.79, 82.26, 81.61, 81.34, 80.45, 79.36, 78.95, 78.26, 77.82, 77.64, 77.45, 77.24, 77.16, 76.83, 76.45, 75.39, 75.28, 75.12, 74.98, 74.89, 74.78, 73.94, 73.13, 72.94, 72.92, 72.52, 71.91, 71.81, 71.25, 71.11, 69.35, 69.23, 69.18, 68.18, 68.11, 68.01, 67.77, 67.54, 61.98, 61.72, 56.03, 30.16, 28.88, 18.01, 18.00, 17.95, 17.92, 11.85, 11.82; LRMS (FAB) calc'd for C<sub>150</sub>H<sub>185</sub>NO<sub>32</sub>SSi<sub>2</sub>Na<sup>+</sup> 2624.

**[0234] Peracetate of globo-H pentenyl glycoside (30).** To a solution of the hexasaccharide (585 mg, 0.224 mmol) in THF (10 mL) was added TBAF (1.0 M THF, 10 equiv., 2.24 mL). The reaction stirred at rt for 3 days, poured into ice water and extracted with EtOAc (3x50 mL). The organic extracts were washed with satd. NaHCO<sub>3</sub> (50 mL) and brine (50 mL), dried over MgSO<sub>4</sub> and concentrated to an oil

which was purified through a short plug of silica gel with EtOAc. The resulting triol was dissolved in anhydrous MeOH (8 mL) and sodium methoxide was added (0.25 mL of a 25% solution in MeOH). The reaction stirred at rt for 18 hours, neutralized with Dowex-H<sup>+</sup>, filtered with MeOH washings and concentrated. To the resulting white solid was added THF (2.0 mL) and condensed liquid NH<sub>3</sub> (~25 mL) at -78 °C. Sodium (~500 mg) was added and the resulting blue solution stirred at -78 °C for 2 hours. The reaction was quenched with anhydrous MeOH (~10 mL), brought to rt and concentrated under a stream of dry N<sub>2</sub> to a volume of ~5 mL. The reaction was neutralized with Dowex-H<sup>+</sup>, filtered with MeOH washing and concentrated to a white solid. The white solid was dissolved in 5.0 mL pyridine and 5.0 mL CH<sub>2</sub>Cl<sub>2</sub> and cooled to 0 °C. A crystal of DMAP was added followed by acetic anhydride (5.0 mL). The ice bath was removed and the reaction stirred at rt overnight. Concentration followed by purification by flash column chromatography (gradient elution 75% EtOAc/hexanes→100% EtOAc→5% MeOH/EtOAc) gave 168 mg (42%) of **30** as a white solid:  $[\alpha]_{22}^D$  4.37° (*c* 1.85, CHCl<sub>3</sub>); IR (CHCl<sub>3</sub> film) 2939, 1747, 1370, 1229, 1066 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ 7.66 (d, 1H, J=6.5 Hz), 5.77 (m, 1H), 5.58 (d, 1H, J=3.2 Hz), 5.47 (d, 1H, J=3.5 Hz), 5.39 (d, 1H, J=3.2 Hz), 5.29 (dd, 1H, J=10.9, 3.0 Hz), 5.24-5.06 (m, 5H), 5.04-5.02 (m, 1H), 4.99-4.85 (m, 4H), 4.74 (dd, 1H, J=10.9, 2.9 Hz), 4.53-4.40 (m, 5H), 4.36 (m, 1H), 4.26 (dd, 1H, J=10.6, 3.4 Hz), 4.18-4.03 (m, 6H), 3.99-3.96 (m, 2H), 3.87-3.81 (m, 3H), 3.77-3.74 (m, 1H), 3.51-3.45 (m, 1H), 3.03 (m, 1H), 2.16 (s, 3H), 2.15 (s, 3x3H), 2.13-2.11 (m, 2H), 2.10 (s, 3H), 2.09 (s, 3H), 2.08 (s, 2x3H), 2.08 (s, 3H), 2.07 (s, 3H), 2.05 (s, 3H), 2.04 (s, 2x3H), 2.00 (s, 3H), 1.97 (s, 2x3H), 1.89 (s, 3H), 1.65 (m, 2H), 1.62 (s, 3H), 1.14 (d, 3H, J=6.5 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz) δ 172.31, 171.55, 170.78, 170.61, 170.57, 170.48, 170.41, 170.30, 170.08, 169.75, 169.61, 169.57, 169.44, 168.96, 137.76, 115.07, 102.05, 101.29, 100.45, 99.23, 98.74, 94.29, 77.24, 77.16, 76.07, 73.68, 73.40, 73.17, 72.63, 72.34, 71.85, 71.77, 71.56, 71.34, 70.83, 70.71, 70.19, 70.08, 69.32, 69.03, 68.88, 68.09, 68.01, 67.59, 67.32, 64.48, 29.80, 28.54, 23.12, 20.90, 20.88, 20.82, 20.74, 20.73, 20.72, 20.71, 20.64, 20.62, 20.55, 20.54, 20.49, 15.91; FAB-HRMS calc'd for C<sub>77</sub>H<sub>107</sub>NO<sub>47</sub>Na<sup>+</sup>; 1820.5911. Found; 1820.5994.

[0235] **Globo-H, pentenyl glycoside (16c).** The peracetate (20 mg, 0.011 mmol) was dissolved in anhydrous MeOH (2.0 mL) and 100  $\mu$ L of sodium methoxide was added (25% solution in MeOH). The reaction stirred at rt for 18 hours, was neutralized with Dowex-H<sup>+</sup> (~pH 6-7), filtered with MeOH washings, concentrated and purified using RP silica gel (H<sub>2</sub>O  $\rightarrow$  1% MeOH/H<sub>2</sub>O) then P-2 Gel (H<sub>2</sub>O eluent) to yield 12 mg (99%) of a white solid.  $[\alpha]_{22}^D$  3.00° (c 1.00, MeOH); IR 3374, 2930, 1641, 1372, 1070 cm<sup>-1</sup>; <sup>1</sup>H NMR (MeOH, 400 MHz)  $\delta$  5.79 (m, 1H), 5.18 (d, 1H, J=3.9 Hz), 4.98 (dm, 1H, J=7.2 Hz), 4.91 (m, 1H), 4.87 (m, 1H), 4.51 (s, 1H), 4.49 (d, 1H, J=1.4 Hz), 4.41-4.36 (m, 2H), 4.24-4.20 (m, 4H), 4.10 (d, 1H, J=2.5 Hz), 4.06-4.00 (m, 3H), 3.94 (s, 1H), 3.87-3.45 (m, 22H), 3.35-3.31 (m, 2H), 3.19 (t, 1H, J=8.8 Hz), 2.10 (m, 2H), 1.96 (s, 3H), 1.66 (m, 2H), 1.19 (d, 3H, J=6.5 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz)  $\delta$  174.53, 139.53, 115.27, 105.50, 105.44, 104.30, 103.96, 102.81, 101.07, 81.29, 80.59, 80.04, 79.16, 78.00, 76.81, 76.57, 76.49, 76.45, 76.39, 75.57, 74.89, 74.69, 73.58, 72.64, 72.49, 71.56, 70.65, 70.63, 70.38, 70.31, 69.70, 68.13, 62.63, 62.59, 61.94, 61.62, 53.11, 49.90, 31.29, 30.14, 23.55, 16.76. [0236] **C. Example 3: Preparation of glycoamino acids and inventive glycopeptides – n-Pentenyl glycoamino acids:**

[0237] **1) Discussion of Synthetic Methods:**

[0238] a. Horner-Emmons olefination with protected glycine derived phosphonate

[0239] In general, it was desired to incorporate the two antigens described above, fucosyl GM1 and globo-H into glycopeptides. In one embodiment, as shown in Figure 13, a transformation utilizing catalytic asymmetric hydrogenation of glycosylated amide esters may be used. The new approach anticipated a Horner-Emmons olefination of the protected aldehyde with a suitably protected glycine derived phosphonate to give an enamide ester. Subsequent catalytic asymmetric hydrogenation would hopefully yield diastereomerically pure glycoamino acid.

[0240] In but one example, an inventive glycoamino acid, based on a peracetylated lactose derivatives was prepared. Specifically the required lactose

derived enamide ester substrate was prepared. The required lactose derived enamide ester substrate was prepared according to Figure 14. Ozonolysis of the NPG **32** (Allen *et al.*, *Chem. Eur. J.* **2000**, *6*, 1366) followed by reductive work-up gave the corresponding aldehyde derivative. The crude aldehyde was then subjected to Horner-Emmons olefination using tetramethylguanidine and phosphonate **33**. Phosphonate **33**, with *N*-Boc and 2-(trimethylsilyl)ethyl ester (TSE) protection (Schmidt *et al.*, *Synthesis* **1984**, *53*; Kawai *et al.*, *Chem. Lett.* **1990**, *577*) was chosen because of the need for the resulting glycoamino acids to be orthogonally suitable for peptide couplings in the presence of acetate carbohydrate protecting groups. The enamide ester **34** was obtained as a single geometric isomer in 88% yield for the 2-step procedure.

[0241] In one preferred embodiment, conditions for asymmetric hydrogenation of enamide ester **34** are detailed. The (*S*, *S*) ligand isomer of ethyl DuPHOS catalyst precursor was utilized, which has been well characterized in these types of systems to give the (*S*)-isomer in the amino acid product. The protected glycoamino acid was obtained in 98% yield and was determined to have been formed with a diastereomeric ratio (dr) of >20:1. Remarkably, the *t*-Boc protons are nearly baseline resolved and, in the asymmetric reaction, the minor isomer could not be detected. <sup>13</sup>C analysis also supports the conclusion that the minor isomer is not formed within the limit of NMR detection. Hydrogenation of **34** with an achiral catalyst (Pd/C, MeOH) produced a 1:1 mixture of R and S configured **35**, providing a comparison for diastereomeric ratio determination. This reaction also indicates that chirality transfer to yield **35** occurs from the chiral ligand and not carbohydrate derived substrate control. A final step to be performed prior to moving to synthesis and assembly of tumor antigens was that of demonstrating deprotectability of the blocking groups contained in the amino acid side chain. In the event, reaction of **35** with TBAF in THF gave acid **36**, suitably prepared for peptide coupling, in 93% yield.

[0242] With the general methodology demonstrated in the lactose model, in other preferred embodiments, advanced hexasaccharides **37** and **38**, as well as other antigens of interest, were investigated. As shown in Table 2, olefination of the peracetylated *n*-pentenyl glycoside of Globo-H, **37**, under the same conditions as

those used in Figure 14, provided the corresponding enamide ester **41** in 72% yield as a single isomer and provided fucosyl GM1 hexasaccharide **16** in 10-22% yield. Notably, through use of the (*S*, *S*)-Et-DuPHOS-Rh<sup>+</sup> catalyst system, the hydrogenation of **41** and **42** proceeded in excellent yield producing **45** and **46** as single diastereomers by <sup>1</sup>H NMR analysis. Compounds **45** and **46** represent the first examples of synthetic glycoamino acids containing the complex oligosaccharides Globo-H and fucosyl GM<sub>1</sub>.

[0243] Similar transformations on two other clinically promising antigens to generate their corresponding glycoamino acids were also performed in certain other embodiments. As discussed previously, Lewis<sup>y</sup> (Le<sup>y</sup>) oligosaccharide has been identified as an important antigen for eliciting antibodies against colon, liver, prostate and ovarian carcinomas (Lloyd *et al.*, *Am. J. Clin. Path.* **1987**, 87, 129; Lloyd *et al.*, *Cancer Biol.* **1991**, 2, 421; Yin *et al.*, *Int. J. Cancer*, **1996**, 65, 406). Previously, both a Le<sup>y</sup>-KLH conjugate vaccine (Danishefsky *et al.* *J. Am. Chem. Soc.* **1995**, 117, 5701) and a clustered Le<sup>y</sup> glycopeptide (of natural  $\alpha$ -O-linked configuration) glycoconjugate attached to either a glycolipid or KLH have been prepared, and have initiated human clinical trials against ovarian cancer with these vaccines have been initiated (Kudryashov *et al.*, *Cancer Immunol. Immunother.* **1998**, 45, 281; Sabbatini *et al.*, *Int. J. Cancer* **2000**, 87, 79).

[0244] The results starting with both Le<sup>y</sup> *n*-pentenyl glycoside **39** and the  $\alpha$ -linked *n*-pentenyl glycoside of the Tn antigen **40** (GalNAc) are presented in Table 2. The pentasaccharide **39** was available as an *intermediate in the synthesis of Le<sup>y</sup> glycopeptide cluster* and consequently illustrates the potential advantage of this strategy. Thus, if immunogenicity is retained in the artificial constructs, these NPG derived glycoamino acids offer a much shorter synthetic route to vaccine glycoconjugates than their native counterparts. As shown in Table 2, olefination of **39** and **40** was uneventful and enamide esters **43** and **44** were obtained in 85% and 75% yields respectively, again as single isomers. Asymmetric hydrogenation, as before, also produced diastereomerically pure glycoamino acids **47** and **48** in excellent yields.

[0245] **Table 2:** Horner-Emmons olefination as applied to the preparation of glycoamino acids:

<p>Conditions: (1) 1. O<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>, MeOH, pyr.; then Me<sub>2</sub>S; (2) TMG, 33, THF, -78 °C</p>		
<p>Conditions: (S, S)-Et-DuPHOS-Rh<sup>+</sup> H<sub>2</sub>, 50 psi, THF</p>		
	product, yield	product, yield, dr
Globo-H (37)	41, 72%	45, 98%, >20:1
Fucosyl GM <sub>1</sub> (38)	42, 10-22%	46, 93%, >20:1
Le <sup>y</sup> (39)	43, 85%	47, 99%, >20:1
α-Tn antigen (40)	44, 75%	48, 99%, >20:1

[0246] b. Via Cross-Metathesis reaction of a suitable Allyl glycoside with a suitably protected allylglycine

[0247] In certain other embodiments, as shown in Scheme 1 below, a transformation utilizing a novel cross metathesis procedure may be used. The new approach involves a Ruthenium-catalyzed cross metathesis reaction of the allyl glycoside construct with a suitably protected allylglycine intermediate to give the corresponding enamide ester adduct. Subsequent catalytic hydrogenation yields the

desired diastereomerically pure glycoamino acid. R represents any carbohydrate domain described herein.

**Scheme 1**

[0248] Initial studies were carried out with peracetyl  $\alpha$ -O-allyl-D-galactose **57** and Fmoc-L-allylglycine benzyl ester **56** (see Table 3).

[0249] **Table 3: Cross-metathesis reaction conditions.**

Entry	Equiv. of 56	Catalyst	Yield (%)
1	2.0	3	26
2	2.0	4	49
3	5.0	4	70

[0250] Fmoc-L-allylglycine benzyl ester **56** was prepared by N-Protection of commercially available L-Allylglycine **55** as its Fmoc ester, followed by protection of the carboxylic moiety as its benzyl ester (see Figure 18). A two-fold excess of allylglycine **56**, in the presence of catalyst **58b** afforded the desired enamide ester **59** in 26% yield, along with dimers of both substrates. When catalyst **58a** was used, the reaction proceeded in 49% yield, which was improved to 70% yield by

increasing the excess of allylglycine **56** to 5 equivalents. These conditions also led to a marked decrease in dimerization of allylglycoside **57**, while increasing the yield of cross-metathesis reaction. Catalytic hydrogenation of **59** yields the desired galactose derived enamide ester substrate **60** in 87% yield as a single geometric isomer. As summarized in Table 4, the methodology was successfully applied to other glycosaccharides, including Globo-H allyl glycoside **37**.

**[0251] Table 4:** Cross-metathesis reaction as applied to the preparation of glycoamino acids:

<b>R</b> =	Conditions: 20 mol% <b>58</b> , CH <sub>2</sub> Cl <sub>2</sub> 40°C, 12 h product, yield	Conditions: H <sub>2</sub> , 3% Pt/C MeOH/H <sub>2</sub> O, 12 h product, yield
 <b>(57)</b>	<b>59</b> , 70%	<b>60</b> , 87%
 <b>(96)</b>	<b>96</b> , 66%	<b>97</b> , n/d
 <b>(99)</b>	<b>99</b> , 70%	<b>100</b> , n/d
 Globo-H <b>(101)</b>	<b>102</b> , 69%	<b>103</b> , 90%

**[0252]** One of ordinary skill in the art will appreciate that this general methodology may be applied to a variety of other antigens of interest. Specifically, any carbohydrate domain available (or synthesized) as an O-allyl construct may be converted to the corresponding glycoaminoacid construct via the reaction steps

described above. Examples of suitable glycosaccharide constructs include, but are not limited to:

[0253] With the glycoamino acids as described in a) and b) above in hand, it would thus be desirable to generate novel glycopeptides. Specifically, in one embodiment, a novel glycopeptide incorporating globo-H, Le<sup>y</sup>, and Tn is provided. Specifically, the C-terminus is modified to include a conjugation handle for carrier protein KLH. The mercaptoacetamide unit has proven to be effective for this purpose. As shown in Figure 15, the Tn glycoamino acid **48** was treated with TBAF to reveal the corresponding carboxylic acid. Coupling with a di-amino spacer terminated in a protected mercaptoacetamide (AcSCH<sub>2</sub>C(O)(CH<sub>2</sub>)<sub>3</sub>NH<sub>2</sub>) under the agency of the BOP reagent (benzotriazol-1-oxytris(dimethylamino)phosphonium hexafluorophosphate) gave the corresponding amide in 50% yield for the 2 steps. Removal of the N-terminal Boc group gave amine **49** as its trifluoroacetate salt. The next antigen, Le<sup>y</sup>, was prepared for coupling by reaction of **47** with TBAF to give acid **50**. Coupling of amine **49** with Le<sup>y</sup> acid **50**, again with the BOP promoter, gave the Tn-Le<sup>y</sup> di-peptide **51** in 86% yield. Lastly, Globo-H glycoamino acid **45** was treated with TBAF to give its corresponding acid **52**. Removal of the Boc protecting group in **51** followed by coupling with acid **52** gave the Tn-Le<sup>y</sup>-Globo-H tri-peptide in 64% yield. Finally, the N-terminal Boc group was removed and the resulting amine capped as its acetate to give tripeptide **53** in 95% yield. With all components in place, the ester protecting groups were removed with hydrazine in degassed methanol to give the fully deprotected glycopeptide **54** (Figure 16) in excellent

yield. As discussed below, the inventive glycopeptides prepared as detailed herein can also be conjugated to a suitable carrier protein or lipid.

[0254]        **2) Experimental General.** DuPHOS-Rh<sup>+</sup> catalysts were purchased from Strem Chemical Co., Newburyport, MA. All other commercial materials (purchased from Aldrich-Sigma) were used without further purification. The following solvents were obtained from a dry solvent system (passed through a column of alumina): THF, diethyl ether (Et<sub>2</sub>O), CH<sub>2</sub>Cl<sub>2</sub>, toluene and benzene. All reactions were performed under an atmosphere of dry N<sub>2</sub>, unless otherwise noted. NMR (<sup>1</sup>H and <sup>13</sup>C) spectra were recorded on a Bruker AMX-400 MHz or Bruker Advance DRX-500 MHz and referenced to residual solvent unless otherwise noted. IR spectra were recorded with a Perkin-Elmer 1600 series-FTIR spectrometer and optical rotations were measured with a Jasco DIP-370 digital polarimeter using a 10-cm path length cell. Low-resolution mass spectral analysis were performed with a JOEL JMS-DX-303 HF mass spectrometer. Analytical TLC was performed on E. Merck silica gel 60 F254 plates and flash column chromatography was performed using the indicated solvents on E. Merck silica gel 60 (40-63 mm) or Sigma H-type silica gel (10-40 mm).

[0255]        **Procedure for the synthesis of 40 (as shown in Figure 17)**

[0256]        **Trichloroacetimidate donor.** The mixture of azidonitrates as shown in Figure 17 (1.66g, 4.41 mmol) was dissolved in CH<sub>3</sub>CN (15 mL) and cooled to 0 °C. To the stirring solution was added Hunig's base (1.2 equiv., 0.925 mL) and benzene thiol (3.0 equiv., 1.35 mL). The reaction mixture was stirred at 0 °C for 1 hour and the ice bath was removed. After an additional 1 hour at room temperature, the reaction was concentrated under a stream of dry nitrogen. The resulting material was dissolved in a minimum amount of CHCl<sub>3</sub> and subjected to flash column chromatography (50% EtOAc/hexanes) to yield the hemiacetals (1.41, 97%). (Note 1: perform this flash in the hood, Note 2: isolate both anomers, which do separate on TLC/flash) The mixture of hemiacetals (1.41 g mg, 4.25 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (8.5 mL) and trichloroacetonitrile (4.25 mL) was added, followed by K<sub>2</sub>CO<sub>3</sub> (5.0 equiv., 2.93 g). The reaction stirred at room temperature

overnight and was filtered through a plug of celite with additional methylene chloride. Concentration of the organic layer, followed by flash column chromatography (10->25% EtOAc/hexanes) gave the  $\beta$ -trichloroacetimidate (1.30 mg, 77%) as a yellow oil. (Note:  $\alpha$ -anomer elutes first, then the  $\beta$ -anomer)

**[0257] Pentenyl glycoside of  $\alpha$ -Tn.** The TCA-donor as shown in Figure 17 (1.30 g, 2.72 mmol) was dissolved in THF (0.2M, 13.6 mL) and pentenyl alcohol (5.0 equiv., 1.2 mL) and cooled to -10 °C (acetone-ice bath). A portion of TMSOTf (0.1 equiv., 0.049 mL) was added and the reaction stirred for 1 hour. Solid NaHCO<sub>3</sub> was added and the reaction was filtered through celite, concentrated and subjected to flash column chromatography (25% EtOAc/hexanes). (Note 1: The diastereomeric anomers do not separate. Their ratio is determined by <sup>1</sup>H NMR. Note 2: The starting materials and products co-elute by TLC - gradient TLC (10% first, then 50%) can be used to visualize the progress of the reaction.) The isolated glycosides were taken up in 10 mL of AcSH and stirred at rt for 2 days. Evaporation of the solvent by a stream of dry nitrogen followed by flash column chromatography (5% acetone/toluene -> 10% acetone/toluene) gave 620 mg of the  $\alpha$ -glycoside (55%) and an undertermined amount of  $\beta$ -glycoside. (Note: Ethyl acetate/hexanes mixtures will also separate anomers, but acetone/toluene was determined to be superior.)

**[0258] General procedure for olefination, 41.** The preparation of enamide 41 (Globo-H) is representative of this procedure. The *n*-pentenyl glycoside 37 (58 mg, 0.0322 mmol) was dissolved in 10:10:1 MeOH:CH<sub>2</sub>Cl<sub>2</sub>:pyridine (3 mL, typically 0.05 M-0.01 M) and cooled to -78 °C. A stream of dry ozone was passed through the reaction mixture until a pale blue color persisted. The ozone source was removed and the reaction stirred at -78 °C for an additional 15 minutes, upon which time a stream of dry nitrogen was applied to remove excess ozone. Dimethyl sulfide (50 equivs., 0.118 mL) was added to the cooled mixture, the ice bath was removed and the reaction was allowed to stir at rt for 4 hours. The reaction was diluted with CH<sub>2</sub>Cl<sub>2</sub> (10mL), washed with water (50mL), and back-extracted with additional CH<sub>2</sub>Cl<sub>2</sub> (2x10 mL). The combined organic layer was dried over anhydrous MgSO<sub>4</sub>

and concentrated. The crude aldehyde was typically not purified, but was azeotroped dry with anhydrous benzene (3x3 mL) and used directly in the next step.

[0259] Phosphonate **33** (1.20 equivs., 14 mg) was dissolved in anhydrous THF (0.3 mL), cooled to -78 °C and tetramethyl guanidine (TMG) (1.25 equivs., 0.005 mL) was added dropwise. The reaction stirred at -78 for 30 minutes, followed by addition of the crude aldehyde (0.0322 mmol) in additional THF (2x0.3 mL, typically 0.1-0.01 M total reaction volume). The reaction was allowed to stir to rt overnight (10-15h), was extracted with EtOAc (10mL), washed with 0.05 M aqueous HCl (50mL) and back-extracted with additional EtOAc (2x10 mL). (Note: All the TMG must be removed prior to asymmetric hydrogenation.) The combined organic layer was dried over MgSO<sub>4</sub>, concentrated and purified by flash column chromatography (75% EtOAc/hexanes -> 100 % EtOAc) to yield the desired enamide ester **41** as a single isomer. 72%, white foam; *R<sub>f</sub>* 0.85 (100% EtOAc); IR (CDCl<sub>3</sub> film) 3373, 2956, 2951, 1748, 1370, 1069 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 500 MHz) δ 6.65 (d, 1H, J=6.4 Hz), 6.44 (m, 1H), 6.07 (bs, 1H), 5.56 (d, 1H, J=3.1 Hz), 5.44 (d, 1H, J=3.4 Hz), 5.37 (d, 1H, J=3.3 Hz), 5.27 (dd, 1H, J=10.9, 3.0 Hz), 5.22 (d, 1H, J=2.6 Hz), 5.20-5.17 (m, 2H), 5.15 (d, 1H, J=2.1 Hz), 5.13 (d, 1H, J=4.9 Hz), 5.09 (dd, 1H, J=10.7, 7.3 Hz), 5.03 (dd, 1H, J=11.1, 3.3 Hz), 4.96 (dd, 1H, J=9.6, 3.5 Hz), 4.92 (dd, 1H, J=11.2, 3.4 Hz), 4.85 (dd, 1H, J=9.6, 8.0 Hz), 4.73 (dd, 1H, J=10.9, 2.5 Hz), 4.50-4.38 (m, 6H), 4.34 (t, 1H, J=6.2 Hz), 4.26-4.21 (m, 3H), 4.16-4.02 (m, 8H), 3.98 (d, 1H, J=2.0 Hz), 3.94 (t, 1H, J=6.4 Hz), 3.86-3.72 (m, 6H), 3.60-3.57 (m, 1H), 3.48-3.46 (m, 1H), 2.94-2.89 (m, 1H), 2.17-2.14 (m, 1H), 2.11-2.08 (m, 1H), 2.04 (s, 3H), 2.038 (s, 3H), 2.033 (s, 6H), 1.99 (s, 3H), 1.98 (s, 3H), 1.97 (s, 3H), 1.967 (s, 3H), 1.962 (s, 3H), 1.95 (s, 3H), 1.92 (s, 9H), 1.89 (s, 3H), 1.857 (s, 3H), 1.854 (s, 3H), 1.78 (s, 3H), 1.63-1.59 (m, 2H), 1.34 (s, 9H), 1.04 (d, 3H, J=6.5 Hz), 0.93-0.90 (m, 2H), -0.06 (s, 9H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 125 MHz) δ 172.20, 171.44, 170.94, 170.65, 170.52, 170.48, 170.44, 170.36, 170.29, 170.21, 170.17, 169.97, 169.63, 169.49, 169.31, 168.85, 164.78, 153.19, 134.70, 126.80, 102.35, 101.99, 101.26, 100.25, 99.12, 99.66, 94.21, 80.24, 76.88, 75.98, 73.61, 73.36, 73.08, 72.80, 72.56, 72.37, 71.81, 71.68, 71.46, 71.28, 70.78, 70.69, 70.67, 70.37, 70.06, 70.01, 68.92, 68.82, 67.99, 67.95, 67.54, 67.28, 66.94, 64.42, 62.14, 61.67, 61.29, 61.09, 60.92, 56.16, 28.12, 27.98, 24.52, 23.80, 23.03, 20.81, 20.73,

[0269] **General procedure for cross-metathesis reaction.** The preparation of enamide **60** (galactose) is representative of this procedure.

[0270] Step 1: Protection of L-allylglycine

[0271] L-allylglycine (**55**, 2.5 g, 21.7 mmol) and Fmoc-*O*-succinimide (8.6 g, 25.5 mmol, 1.2 equiv) were mixed in 200 mL acetone:water (3:1) mixture and treated with solid  $\text{NaHCO}_3$  (18.2 g, 217 mmol, 10.0 equiv). The reaction was stirred at rt for 24 h, diluted with EtOAc (200 mL) and washed with 1N HCl (300 mL) and brine (300 mL). The organic layer was dried ( $\text{MgSO}_4$ ) and concentrated. The crude carbamate was dissolved in DMF (100 mL) and treated with  $\text{NaHCO}_3$  (5.5 g, 65.1 mmol, 3.0 equiv) and benzyl bromide (25.4 mL, 217 mmol, 10.0 equiv). The reaction mixture was stirred at rt for 24 h, diluted with EtOAc (150 mL) and washed with water (2×200 mL) and brine (200 mL). The organic layer was dried ( $\text{MgSO}_4$ ) and purified by silica gel chromatography (12-20% EtOAc/hexane) affording 7.9 g (86%) of **55** as a white solid:  $^1\text{H}$  NMR (400 MHz)  $\delta$  7.77 (d,  $J = 7.5$  Hz, 2H), 7.59 (d,  $J = 7.5$  Hz, 2H), 7.43 - 7.29 (m, 9H), 5.71 - 5.62 (m, 1H), 5.34 (d,  $J = 8.3$  Hz, 1H), 5.20 (ABq,  $J = 8.2$  Hz, 2H), 5.15 - 5.08 (m, 2H), 4.56 - 4.53 (m, 1H), 4.39 (d,  $J = 7.2$  Hz, 2H), 4.23 (t,  $J = 7.2$  Hz, 1H), 2.62 - 2.50 (m, 2H); LRMS (ESI)  $M_{\text{calc}}$ . 427.1 for  $C_{27}H_{25}NO_4$ , ( $M+\text{Na}$ )<sub>found</sub> 450.1.

[0272] Step 2: Cross metathesis reaction:

[0273] Peracetylated *O*-allyl-D-galactose (**57**; 185 mg, 0.47 mmol) was mixed with Fmoc-L-allylglycine-OBn (**56**, 1.01 g, 2.38 mmol, 5.0 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (3 mL) and treated with bis(tricyclohexylphosphine) ruthenium Grubbs catalyst **58** (39 mg, 0.047 mmol, 0.1 equiv). The reaction was heated to reflux. After 6h, another 0.1 equiv of catalyst was further added. The reaction was cooled to rt after 12 h (total) and purified by silica gel chromatography (20-28-32-40% EtOAc/hexanes) to afford metathesis product **59** (250 mg, 70 %), along with 392 mg (39% of 5.0 equiv) recovered **58**.

[0274] Step 3: Catalytic hydrogenation:

[0275] The *E:Z* mixture **59** (26 mg, 0.03 mmol) was dissolved in 1.1 mL methanol:water (10:1) and treated with 3% Pt/C (26 mg). The reaction flask was stirred under a hydrogen balloon for 12 h, followed by filtration to remove the solid catalyst. The filtrate was concentrated and purified by silica gel chromatography (64% EtOAc/hexane, with 1% AcOH) to afford amino acid **60** (20 mg, 87%) as a white solid: <sup>1</sup>H NMR (400 MHz) δ 7.77 (d, *J* = 7.5 Hz, 2H), 7.61 (d, *J* = 7.5 Hz, 2H), 7.40 (t, *J* = 7.5 Hz, 2H), 7.31 (t, *J* = 7.5 Hz, 2H), 5.56 (d, *J* = 8.1 Hz, 1H), 5.45 (d, *J* = 3.0 Hz, 1H), 5.34 (dd, *J* = 10.0, 3.0 Hz, 1H), 5.21 - 5.10 (m, 2H), 4.43 - 4.38 (m, 3H), 4.25 - 4.16 (m, 3H), 4.25 - 4.00 (m, 1H), 3.79 - 3.76 (m, 1H), 3.47 - 3.44 (m, 1H), 2.16 (s, 3H), 2.08 (s, 3H), 2.05 (s, 3H), 2.00 (s, 3H), 1.89 - 1.86 (m, 2H), 1.67 - 1.65 (m, 2H), 1.55 - 1.48 (m, 2H); LRMS (ESI) *M*<sub>calc.</sub> 699.2 for C<sub>35</sub>H<sub>41</sub>NO<sub>14</sub>, (*M*+Na)<sub>found</sub> 722.3.

[0276] **Globo-H glycoamino acid 103**

[0277] Peracetylated Globo-H allyl glycoside (20 mg, 0.011 mmol, Ref: Park, T.K.; Kim, I.J.; Hu, S.; Bilodeau, M.T.; Randolph, J.T.; Kwon, O.; Danishefsky, S.J. *J. Am. Chem. Soc.* **1996**, *118*, 11488-11500) and Fmoc-L-

allylglycine benzyl ester (24 mg, 0.056 mmol, 5.0 equiv) in methylene chloride (0.05 mL) were treated bis(tricyclohexylphosphine) ruthenium Grubbs catalyst (2 mg, 0.001 mmol, 0.1 equiv). The reaction was heated to reflux. After 6h, another 0.1 equiv of catalyst was further added. The reaction was cooled to rt after 12 h (total) and purified by silica gel chromatography (80-90% EtOAc/hexanes) to afford metathesis product (16 mg, 69 %). The *E:Z* mixture (20 mg, 0.009 mmol) was dissolved in 0.55 mL methanol:water (10:1) and treated with 3% Pt/C (20 mg). The reaction flask was stirred under a hydrogen balloon for 12 h, followed by filtration to remove the solid catalyst. The filtrate was concentrated and purified by silica gel chromatography (EtOAc - 1% AcOH/EtOAc) to afford Globo-H amino acid (17 mg, 90%) as a white solid:  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.77 (d,  $J = 7.5$  Hz, 2H), 7.59 (d,  $J = 7.5$  Hz, 2H), 7.40 (t,  $J = 7.5$  Hz, 2H), 7.31 (t,  $J = 7.5$  Hz, 2H), 6.77 (d,  $J = 8.0$  Hz, 1H), 5.59 (d,  $J = 2.7$  Hz, 1H), 5.54 (d,  $J = 10.0$  Hz, 1H), 5.47 (d,  $J = 3.0$  Hz, 1H), 5.40 (d,  $J = 3.0$  Hz, 1H), 5.30 (dd,  $J = 11.0, 3.1$  Hz, 1H), 5.27 - 5.20 (m, 3H), 5.05 - 4.98 (m, 2H), 4.94 (dd,  $J = 10.5, 3.1$  Hz, 1H), 4.87 (t,  $J = 8.5$  Hz, 1H), 4.76 (dd,  $J = 10.1, 2.3$  Hz, 1H), 4.60 - 4.34 (m, 10H), 4.35 - 4.23 (m, 2H), 4.20 - 3.94 (m, 11H), 3.93 - 3.72 (m, 5H), 3.69 - 3.62 (m, 1H), 3.58 - 3.52 (m, 1H), 3.21 - 3.06 (m, 1H), 2.19 - 2.14 (m, 12H), 2.12 (s, 3H), 2.11 - 2.02 (m, 27H), 2.01 (s, 3H), 1.99 - 1.95 (m, 6H), 1.93 (s, 3H), 1.82 - 1.68 (m, 2H), 1.67 - 1.56 (m, 2H), 1.53 - 1.40 (m, 2H), 1.15 (d,  $J = 6.2$  Hz, 3H); LRMS (ESI)  $M_{\text{calc}}$  2080.6 for  $\text{C}_{93}\text{H}_{120}\text{N}_2\text{O}_{51}$ ,  $(M+H)_{\text{found}}$  2081.9,  $(M+\text{Na})_{\text{found}}$  2103.7.

**[0278] General procedure for *N*-Boc deprotection.** The desired glycoamino acid (0.100 mmol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (3.0mL) with stirring. Trifluoroacetic acid (TFA) (3.0mL) was added dropwise and the reaction stirred at rt for 1 hour. The mixture was then concentrated with a stream of dry  $\text{N}_2$  and azeotroped with anhydrous benzene (2x5mL) to give the crude amine as its TFA salt which was typically used without further purification.

**[0279] General procedure for TSE ester deprotection.** The desired glycoamino acid (0.100 mmol) was dissolved in THF (1.0-3.0 mL) and cooled to 0 °C. A 1.0 M solution of TBAF in THF (0.250 mmol, 2.5 equivs.) was added

dropwise, the ice bath removed and the reaction stirred at rt for 1-2 hour, as judged by TLC. (Note: prolonged reaction times, *i.e.* >10 h, may result in deacetylation.) The reaction mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (10mL), washed with 0.05M aqueous HCL (50 mL), and back-extracted with additional CH<sub>2</sub>Cl<sub>2</sub> (2x10 mL). The combined organic layer was dried over anhydrous Mg<sub>2</sub>SO<sub>4</sub> and concentrated. The crude acid was typically used without further purification. **Acid 36:** <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ 5.22 (d, 1H, J=2.8 Hz), 5.07 (t, 1H, J=9.3 Hz), 4.98 (dd, 1H, J=10.4, 5.9 Hz), 4.84 (dd, 1H, J=10.4, 3.5 Hz), 4.75 (dd, 1H, J=9.5, 8.0 Hz), 4.42-4.35 (m, 2H), 4.34-4.31 (m, 1H), 4.15-4.14 (m, 1H), 4.03-3.94 (m, 4H), 3.77-3.65 (m, 5H), 3.49-3.45 (m, 1H), 3.37-3.33 (m, 1H), 3.10-3.07 (m, 1H), 2.03 (s, 3H), 2.00 (s, 3H), 1.96 (s, 3H), 1.94 (s, 3H), 1.92 (s, 3H), 1.84 (s, 3H), 1.51-1.46 (m, 4H), 1.32 (s, 9H).

**[0280] General procedure for BOP reagent promoted peptide coupling.**

The desired amine and acid (equimolar amounts) were azeotroped together with anhydrous benzene and dried under high vacuum. The mixture was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (0.1-0.05M), BOP reagent (1.25 equivs) was added and the solution cooled to 0 °C over 15 minutes. A dropwise addition of Hunig's base (15 equivs.) was followed by removal of the ice bath. The reaction stirred at rt for 2-4 h, as judged by TLC. Concentration of the reaction mixture was followed by purification by flash column chromatography. In cases where bi-product HMPA was difficult to remove, the peptide was subjected to sephadex purification (LH-20, MeOH).

**[0286]        3) Preparation of Polycarbohydrate (globo H, Le<sup>y</sup>, Tn) cluster-KLH conjugate using bifunctional cross linker method:**

**[0287]**        Polycarbohydrate (globo H, Le<sup>y</sup>, Tn) cluster is conjugated as described below using maleimidobenzoyl-N-hydroxysuccinimide ester (MBS) which is a heterobifunctional reagent. At neutral pH it crosslinks amino groups with succinimide and then with thiol groups with maleimide. The thiol group is provided by the cysteine residue of peptide backbone of cluster and the amino groups by the N-terminal and lysine side-chain of the KLH. After linkage MBS to KLH the unreacted MBS is purified by column and cross-linked to cysteine on the synthetic polycarbohydrate cluster. The unbound antigen is removed by passage of the reaction mixture through a CentriPrep 30 filter with a 30,000 molecular weight cut-off. The epitope ratio is then calculated by estimation of protein content by standard method and carbohydrate by high-pH anion-exchange chromatography with pulsed amperometric detection (HPAEC-PAD) method.

**[0288]        4) Preparation of Polycarbohydrate (TF, Le<sup>y</sup>, Tn) cluster-KLH conjugate using bifunctional cross linker method:**

Polycarbohydrate (TF, Le<sup>y</sup>, Tn) cluster is prepared in a similar fashion as that described in 3) above.

**[0289]        D. Example 4: Synthesis of n-alkylene Gb3 and conjugates thereof**

**[0290]        1) Discussion of Synthesis:**

**[0291]**        As discussed above, in one aspect of the invention, the synthesis of Gb3 pentenyl glycoside **80** is provided (See Scheme 2). In one embodiment of the present invention, the synthesis of the disaccharide **73** starting from the known monosaccharides **68** and **70**, was first undertaken. Saccharide **68** was protected as its dioxolopyranone **69**. Selective protection of **70** gave bibenzyl ether **71**.

Coupling of **70** and **71** under suitable conditions gives the desired disaccharide **72**, which, upon reaction with BnBr in the presence of NaH, yields disaccharide **73**. Partial deprotection of **73**, followed by reprotection the primary and equatorial hydroxyl groups as their benzyl ethers gives intermediate **75**, which, upon reaction with fluoro monosaccharide donor **76** under suitable conditions, gives trisaccharide construct **77**.

**Scheme 2**

[0292] In but one example, the use of a n-pentenyl glycoside was considered (For a review of n-pentenyl glycosides, see Fraser-Reid *et al.*, *Synlett*, **1992**, 927; Udodong *et al. J. Am. Chem. Soc.* **1993**, 115, 7886; Merritt *et al. J. Am. Chem. Soc.* **1994**, 116, 8334; Fraser-Reid *et al.* **1990**, 55, 6068; Mootoo *et al. J. Am. Chem. Soc.* **1988**, 110, 2662; Mootoo *et al. J. Am. Chem. Soc.* **1989**, 111, 8540 and references therein). N-pentenyl glycosides are stable to a range of reaction conditions and reagents, but are readily activated for glycosidation reactions by treatment with a halogen oxidant. As a result of their stability and the neutral conditions required for their activation, pentenyl glycosides have been demonstrated to be valuable linkages for mechanistic and synthetic studies. Additionally, a terminal pentenyl group, or more generally a terminal alkenyl group, could also provide a handle for bioconjugation. Thus, in one embodiment, trisaccharide **77** may be reacted with pentenyl alcohol and anhydrous zinc chloride (Gordon *et al. Carbohydrate Res.* **1990**, 206, 361) to afford the desired Gb3 n-pentenyl glycoside **80**. Indeed, with the pentenyl glycoside in place, global deprotection of **80** is possible.

[0293] In certain embodiments, a Gb3 glycoconjugate may be prepared. Ozonolysis of intermediate **80**, thereby producing the corresponding aldehyde derivative, followed by coupling to KLH using reductive amination under the agency of sodium cyanoborohydride and global deprotection yields the desired Gb3-KLH glycoconjugate.

[0294] **2) Experimentals**

[0295] N-pentenyl Gb3-KLH glycoconjugate:

[0296] Sodium (38 mg, 1.69 mmol, 60.0 equiv) was added to condensed liquid ammonia (25 mL) at  $-78^{\circ}\text{C}$ . Pentenyl trisaccharide **1** (37 mg, 0.024 mmol; Ref: Allen, J.R.; Allen, J.G.; Zhang, X.F.; Williams, L.J.; Zatorski, A.; Ragupathi, G.; Livingston, P.O.; Danishefsky, S.J. *Chem. Eur. J.* **2000**, *6*, 1366-1375) in THF (0.5 mL) was added to the resulting blue solution, and the reaction was stirred at  $-78^{\circ}\text{C}$  for 45 min. MeOH (2 mL) was added to quench the reaction, followed by warming to rt to evaporate the condensed ammonia. Solid  $\text{NH}_4\text{Cl}$  (100 mg) was added, followed by filtration of the solids. The filtrate was concentrated, and the crude sugar was dissolved in 1:1:1 DMF:THF: $\text{Et}_3\text{N}$  (1.5 mL), followed by DMAP (1 mg) and  $\text{Ac}_2\text{O}$  (0.14 mL, 1.48 mmol, 53.0 equiv). The reaction was stirred at rt for 15 h, diluted with EtOAc (5 mL) and washed with water (5 mL). The aqueous layer was extracted with EtOAc ( $2 \times 5$  mL). The combined organic layers were dried ( $\text{MgSO}_4$ ), filtered, concentrated and purified by silica gel chromatography (72% EtOAc/hexanes) to afford peracetate **2** (20 mg, 84%) as a colorless oil.

Peracetate **2** (18 mg, 0.018 mmol) in MeOH (1 mL) was treated with solid NaOMe (24 mg, 0.45 mmol, 25.0 equiv) and stirred at rt for 24 h. The reaction was quenched with Amberlite IR-120 acidic resin (20 mg), filtered, concentrated and purified by reverse phase chromatography (RP-18 silica gel, 20% MeOH/H<sub>2</sub>O) to afford Gb3 trisaccharide **3** (11 mg, 99%) as a white solid: <sup>1</sup>H NMR (400 MHz, D<sub>2</sub>O)  $\delta$  5.89 (ddt,  $J$  = 17.1, 10.4, 6.8 Hz, 1H), 5.07 (d,  $J$  = 17.4 Hz, 1H), 5.00 (d,  $J$  = 10.2 Hz, 1H), 4.92 (d,  $J$  = 3.7 Hz, 1H), 4.50 - 4.45 (m, 2H), 4.34 (t,  $J$  = 6.4 Hz, 1H), 4.01 (m, 2H), 3.96 (d,  $J$  = 11.0 Hz, 1H), 3.95 - 3.87 (m, 3H), 3.84 - 3.79 (m, 3H), 3.78 - 3.73 (m, 2H), 3.73 - 3.66 (m, 3H), 3.64 - 3.61 (m, 2H), 3.58 - 3.53 (m, 2H), 3.27 (t,  $J$  = 8.4 Hz, 1H), 2.15 - 2.03 (m, 2H), 1.74 - 1.67 (m, 2H); <sup>13</sup>C NMR (100 MHz, D<sub>2</sub>O)  $\delta$  140.0, 116.0, 104.5, 103.2, 101.5, 79.9, 78.6, 76.7, 76.0, 75.7, 74.2, 73.4, 72.1, 70.4, 70.1, 69.8, 61.7, 61.6, 61.3, 30.6, 29.2; LRMS (ESI)  $M_{\text{calc}}$ . 572.2 for C<sub>23</sub>H<sub>40</sub>O<sub>16</sub>, ( $M$ +Na)<sub>found</sub> 595.2.

[0297] **E. Example 5: Preparation of Gb3-glycoside-glycoamino acids and trimeric Gb3 glycopeptides 90 and 92**

[0298] **1) Synthesis of Gb3 glycoamino acid 10 (Figure 20B)**

[0299] Sodium (193 mg, 8.41 mmol, 60.0 equiv) was added to condensed liquid ammonia (30 mL) at  $-78$  °C. Glycal **4** (162 mg, 0.14 mmol; Ref: Park, T.K.; Kim, I.J.; Hu, S.; Bilodeau, M.T.; Randolph, J.T.; Kwon, O.; Danishefsky, S.J. *J. Am. Chem. Soc.* **1996**, *118*, 11488-11500) in THF (2.0 mL) was added to the resulting blue solution, and the reaction was stirred at  $-78$  °C for 45 min. MeOH (5

mL) was added to quench the reaction, followed by warming to rt to evaporate the condensed ammonia. Solid  $\text{NH}_4\text{Cl}$  (445 mg, 8.41 mmol, 60.0 equiv) was added, followed by filtration of the solids. The filtrate was concentrated, and the crude sugar was dissolved in 1:1:1 DMF:THF: $\text{Et}_3\text{N}$  (6.9 mL), followed by DMAP (10 mg) and  $\text{Ac}_2\text{O}$  (0.7 mL, 7.42 mmol, 53.0 equiv). The reaction was stirred at rt for 15 h, diluted with EtOAc (25 mL) and washed with water (25 mL). The aqueous layer was extracted with EtOAc ( $2 \times 25$  mL). The combined organic layers were dried ( $\text{MgSO}_4$ ), filtered, concentrated and purified by silica gel chromatography (90% EtOAc/hexanes) to afford peracetate **5** (112 mg, 98%) as a white foam:  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  6.36 (d,  $J = 6.0$  Hz, 1H), 5.53 (d,  $J = 2.2$  Hz, 1H), 5.38 – 5.32 (m, 2H), 5.15 – 5.10 (m, 2H), 4.95 (d,  $J = 3.3$  Hz, 1H), 4.80 (dd,  $J = 5.9, 3.1$  Hz, 1H), 4.74 (dd,  $J = 9.8, 2.1$  Hz, 1H), 4.63 (d,  $J = 7.8$  Hz, 1H), 4.47 (t,  $J = 6.8$  Hz, 1H), 4.41 – 4.34 (m, 2H), 4.18 – 4.02 (m, 5H), 3.97 – 3.94 (m, 2H), 3.75 (t,  $J = 6.6$  Hz, 1H), 2.08 (s, 3H), 2.06 (s, 6H), 2.03 – 2.01 (m, 12H), 1.99 (s, 3H), 1.94 (s, 3H);  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ )  $\delta$  170.5, 170.4, 170.3, 170.3, 170.2, 169.9, 169.8, 169.6, 168.8, 145.2, 100.8, 99.3, 99.0, 77.2, 74.5, 74.0, 72.4, 71.5, 69.1, 68.5, 68.4, 67.6, 67.1, 66.9, 61.8, 61.2, 60.2, 20.9, 20.7, 20.6, 20.5, 20.4, 20.3; LRMS (ESI)  $M_{\text{calc}}$ . 848.2 for  $\text{C}_{36}\text{H}_{48}\text{O}_{23}$ ,  $(M+\text{Na})_{\text{found}}$  871.3.

[0300] A solution of glycal **5** (181 mg, 0.213 mmol) in methylene chloride (1 mL) was cooled to 0 °C and treated with 2,2'-dimethyldioxirane (7 mL of a 0.06 M solution in acetone, 2.0 equiv). The reaction mixture was concentrated under vacuum after 45 min, and further dried by the addition of methylene chloride (1 mL) and subsequent evaporation, while maintaining the temperature at 0 °C. The crude glycal epoxide was dissolved in a 1:1 THF:allyl alcohol mixture (4 mL), cooled to –78 °C and was treated with  $\text{ZnCl}_2$  (0.26 mL of a 1.0 M solution in diethyl ether, 1.2 equiv). The reaction was allowed to warm to rt slowly, and was maintained at that

temperature for 15 h. EtOAc (20 mL) was added, and the solution was washed with a saturated solution of NaHCO<sub>3</sub> (20 mL), brine (20 mL), dried (MgSO<sub>4</sub>), filtered, concentrated and purified by silica gel chromatography (60 - 76% EtOAc/hexanes) to afford allyl glycoside **6** (99 mg, 52%) as a colorless oil, along with 64 mg (34%) of the corresponding  $\alpha$ -manno diastereomer: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  5.89 (ddt,  $J$  = 16.8, 11.4, 6.2 Hz, 1H), 5.55 (d,  $J$  = 2.2 Hz, 1H), 5.34 (dd,  $J$  = 11.0, 3.2 Hz, 1H), 5.29 (d,  $J$  = 17.2 Hz, 1H), 5.20 (d,  $J$  = 10.5 Hz, 1H), 5.15 (dd,  $J$  = 11.0, 3.4 Hz, 1H), 5.10 – 5.05 (m, 2H), 4.96 (d,  $J$  = 3.4 Hz, 1H), 4.71 (dd,  $J$  = 10.8, 2.2 Hz, 1H), 4.56 – 4.30 (m, 6H), 4.16 – 4.05 (m, 5H), 3.99 (s, 1H), 3.82 - 3.68 (m, 2H), 3.61 – 3.58 (m, 2H), 3.47 (t,  $J$  = 8.5 Hz, 1H), 2.72 (bs, 1H), 2.19 (s, 3H), 2.10 (s, 3H), 2.08 (s, 3H), 2.05 – 2.02 (m, 15H), 1.96 (s, 3H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>)  $\delta$  170.6, 170.5, 170.4, 170.3, 169.9, 169.4, 168.7, 133.3, 118.2, 101.3, 100.8, 99.5, 76.8, 76.2, 74.9, 74.7, 72.7, 72.6, 72.5, 71.7, 70.3, 68.8, 68.7, 67.8, 67.0, 66.9, 62.3, 61.3, 60.2, 20.8, 20.7, 20.6, 20.6, 20.5, 20.5, 20.4; LRMS (ESI)  $M_{\text{calc}}$ . 922.3 for C<sub>39</sub>H<sub>54</sub>O<sub>25</sub>, (M+H)<sub>found</sub> 923.3, (M+Na)<sub>found</sub> 945.3.

[0301] A solution of alcohol **6** (80 mg, 0.086 mmol) in methylene chloride (2.5 mL) was treated with Et<sub>3</sub>N (0.06 mL, 0.43 mmol, 5.0 equiv), DMAP (10 mg, 0.086 mmol, 1.0 equiv) and acetic anhydride (0.035 mL, 0.346 mmol, 4.0 equiv) and stirred at rt. After 5 h, the reaction mixture was poured into a saturated solution of NaHCO<sub>3</sub> (10 mL) and extracted with EtOAc (3 × 10 mL). The combined organic layers were dried (MgSO<sub>4</sub>), filtered, concentrated and purified by silica gel chromatography (60 - 68% EtOAc/hexanes) to afford peracetate **7** (81 mg, 99%) as a colorless foam: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  5.82 (ddt,  $J$  = 16.8, 10.7, 5.8 Hz, 1H), 5.57 (d,  $J$  = 2.3 Hz, 1H), 5.37 (dd,  $J$  = 11.0, 3.2 Hz, 1H), 5.27 (d,  $J$  = 2.2 Hz, 1H), 5.22 – 5.14 (m, 3H), 5.08 (dd,  $J$  = 10.8, 7.8 Hz, 1H), 4.96 (d,  $J$  = 3.5 Hz, 1H), 4.91 (t,  $J$  = 8.6 Hz, 1H), 4.71 (dd,  $J$  = 10.8, 2.2 Hz, 1H), 4.58 – 4.39 (m, 5H), 4.29

(dd,  $J = 13.2, 4.8$  Hz, 1H), 4.17 – 4.04 (m, 5H), 3.95 (s, 1H), 3.81 – 3.73 (m, 2H), 3.63 – 3.59 (m, 1H), 2.11 (s, 3H), 2.10 (s, 3H), 2.06 (s, 6H), 2.05 (s, 3H), 2.05 (s, 3H), 2.04 (s, 3H), 2.03 (s, 6H), 1.97 (s, 3H);  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ )  $\delta$  170.6, 170.4, 170.0, 169.6, 169.6, 169.4, 168.8, 133.3, 117.5, 101.0, 99.5, 99.2, 76.8, 76.4, 73.0, 72.7, 72.4, 71.7, 71.6, 69.9, 68.9, 68.7, 67.8, 67.0, 67.0, 62.1, 61.2, 60.2, 20.8, 20.8, 20.6, 20.6, 20.5, 20.5, 20.4; LRMS (ESI)  $M_{\text{calc}}$ . 964.3 for  $\text{C}_{41}\text{H}_{56}\text{O}_{26}$ ,  $(M+H)_{\text{found}}$  965.2,  $(M+\text{Na})_{\text{found}}$  987.3.

[0302] Peracetylated Gb3 allyl glycoside **7** (10 mg, 0.01 mmol) and Fmoc-L-allylglycine benzyl ester **8** (25 mg, 0.05 mmol, 5.0 equiv) in methylene chloride (0.05 mL) were treated bis(tricyclohexylphosphine) ruthenium Grubbs catalyst (1 mg, 0.001 mmol, 0.1 equiv). The reaction was heated to reflux. After 6h, another 0.1 equiv of catalyst was further added. The reaction was cooled to rt after 12 h (total) and purified by silica gel chromatography (40% acetone/hexanes) to afford metathesis product **9** (9 mg, 70 %). The *E:Z* mixture **9** (78 mg, 0.057 mmol) was dissolved in 0.55 mL methanol:water (10:1) and treated with 3% Pt/C (70 mg). The reaction flask was stirred under a hydrogen balloon for 12 h, followed by filtration to remove the solid catalyst. The filtrate was concentrated and purified by silica gel chromatography (EtOAc - 1% AcOH/EtOAc) to afford Gb3 amino acid **10** (58 mg, 81%) as a white solid:  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.76 (d,  $J = 7.5$  Hz, 2H), 7.60 (d,  $J = 7.5$  Hz, 2H), 7.40 (t,  $J = 7.5$  Hz, 2H), 7.31 (t,  $J = 7.5$  Hz, 2H), 5.59 (d,  $J = 2.6$  Hz, 1H), 5.50 (d,  $J = 7.9$  Hz, 1H), 5.39 (dd,  $J = 11.0, 3.0$  Hz, 1H), 5.22 – 5.16 (m, 2H), 5.09 (dd,  $J = 10.4, 8.0$  Hz, 1H), 5.01 (s, 1H), 4.98 (d,  $J = 3.2$  Hz, 1H), 4.87 (t,  $J = 8.5$  Hz, 1H), 4.75 – 4.71 (m, 1H), 4.53 – 4.38 (m, 6H), 4.23 (t,  $J = 6.9$  Hz, 1H), 4.19 – 4.08 (m, 4H), 4.00 (s, 1H), 3.81 – 3.73 (m, 3H), 3.64 – 3.61 (m, 1H), 3.48 –

3.46 (m, 1H), 2.13 (s, 3H), 2.10 (s, 3H), 2.06 (s, 9H), 2.05 (s, 6H), 2.03 (s, 3H), 2.02 (s, 3H), 1.98 (s, 3H), 1.92 - 1.89 (m, 1H), 1.83 - 1.81 (m, 1H), 1.60 - 1.54 (m, 2H), 1.30 - 1.24 (m, 2H);  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ )  $\delta$  175.1, 170.7, 170.6, 170.5, 170.4, 170.0, 169.9, 169.6, 169.5, 168.8, 156.0, 143.7, 141.2, 134.4, 129.7, 128.9, 128.5, 127.7, 127.0, 125.0, 119.9, 101.0, 100.4, 99.5, 79.1, 77.2, 76.3, 73.0, 72.7, 72.5, 71.8, 69.3, 68.9, 68.8, 67.8, 67.0, 62.1, 60.2, 53.6, 47.1, 31.6, 28.8, 21.5, 20.9, 20.8, 20.6, 20.6, 20.5, 20.4; LRMS (ESI)  $M_{\text{calc}}$ . 1275.4 for  $\text{C}_{59}\text{H}_{73}\text{NO}_{30}$ ,  $(M+\text{H})_{\text{found}}$  1276.3,  $(M+\text{Na})_{\text{found}}$  1298.4.

**[0303]** 2) *Synthesis of trimeric Gb3 glycopeptides 90 and 92*

**[0304]** As depicted below, peptide coupling of intermediate **10**, followed by attachment of the resulting trimeric peptide to a suitable linker and global deprotection yields the desired trimeric glycopeptide **90**. Conjugation to KLH under suitable conditions affords trimeric glycopeptide **92**.

**[0305]** 2) *Synthesis of trimeric Gb3 glycopeptides 91 and 93 (Figure 21) - Discussion of Synthetic Methods:*

**[0306]** As described above, Gb3 glycoamino acids may be prepared. In certain embodiments, Gb3 glycoamino acid constructs are provided comprising a Gb3 epitope linked to an aliphatic amino acid moiety through a monosaccharide moiety. The synthetic route that we have been investigating towards this end relies

on the initial synthesis of a suitably protected Gb3 glycal (**77**), which was carried out as detailed herein (Figures 20A and B). With the glycal in hand, we began an investigation into incorporating monosaccharide amino acid **82** acceptor at the reducing end. Despite the use of several different donor types (**78**, **79**, **80**, **81**), efforts directed at coupling the Gb3 trisaccharide and the acceptor **82** were unsuccessful (Scheme 2).

Scheme 2

[0307] We have, thus, been led to investigate an alternative approach, in which monosaccharide amino acid acceptor **82** is coupled to the AB disaccharide portion of Gb3, and then the resulting adduct is coupled with the C residue, thereby generating the required Gb3-GalNAc glycoamino acid. Initial experiments in this vein have shown that the coupling is, indeed, possible using the peracetylated lactose donor **84** (Scheme 3).

Scheme 3

[0308] Consequently, the orthogonally protected lactal residue **87** has been prepared (Scheme 4) for introduction of monosaccharide amino acid acceptor **82** into this piece. As depicted in Scheme 4 (and in more details in Figure 21), conversion of **87** to the corresponding donor, followed by coupling with monosaccharide amino acid acceptor **82**, removal of the PMB group and capping with a suitable galactose donor generates the desired glycoamino acid **88**. Hence, in certain embodiments, clustered variants of Gb3 are provided. Given the structural similarity of Gb3 to the reducing end of Globo-H, the approach developed to synthesize the Gb3-GalNAc glycoamino acid will potentially be applicable to the synthesis of the corresponding glycoamino acid derived from Globo-H.

Scheme 4

[0309] *F. Example 6: Immunological Studies*

[0310] It will be appreciated that the inventive glycoconjugates and glycopeptides, as provided herein, are useful for the treatment of cancer and are useful for inducing an antibody response in a subject. Typical protocols for the use of such glycoconjugates and glycopeptides are described in more detail below, and are also detailed in certain references incorporated herein.

**[0311] 1) Preparation of Vaccine**

**[0312]** Conjugate vaccines **63** and **64** (Figure 23) were prepared as follows. KLH (Sigma Chemical Co, MO, MW  $8.6 \times 10^6$ ) was modified using *m*-maleimidobenzoyl-*N*-hydroxysuccinimide ester (MBS) (Pierce Co., Rockford, IL) as described (Zhang, S., Graeber, L. A., Helling, F., Ragupathi, G., Adluri, S., Lloyd, K. O. & Livingston, P. O. (1996) *Cancer Research* **56**, 3315-3319). Construct **61**, containing TF, Le<sup>y</sup>, and Tn, and construct **62**, containing Globo-H, Le<sup>y</sup>, and Tn, were prepared by total synthesis using solution phase peptide synthesis from the appropriately protected constituent glycoamino acids (Williams, L. J., Harris, C. R., Glunz, P. W. & Danishefsky, S. J. (2000) *Tetrahedron Lett.* **41**, 9505-9508. Allen, J. R., Harris, C. A. & Danishefsky, S. J. (2001) *J. Am. Chem. Soc.* **123**, 1890-1897). The sulfhydryl function was incorporated to facilitate attachment to KLH. Global deprotection of the synthetic material revealed compounds **61** and **62**. Addition of construct **61** or **62** to the maleimide-derivatized KLH was achieved by incubating the mixture at room temperature for 3 hours, followed by removal of the unreacted synthetic glycopeptide peptide using a 30,000 molecular cut-off Centriprep filter (Zhang, S., Graeber, L. A., Helling, F., Ragupathi, G., Adluri, S., Lloyd, K. O. & Livingston, P. O. (1996) *Cancer Research* **56**, 3315-3319).

**[0313] 2) Immunization of Mice**

**[0314]** Groups of five mice (C57BL; Female, 6 weeks of age, from Jackson Laboratory, Bar Harbor, ME) are immunized subcutaneously as follows: Group 1 – immunized with construct **62** (10 µg), plus QS-21 (10 µg) (Antigenic Inc., NY, NY); Group 2 – immunized with **62** (10 µg), plus KLH (not conjugated to **62**), plus QS-21 (10 µg); Group 3 – immunized with **4** (3 µg), plus QS-21 (10 µg); Group 4 – immunized with **64** (3 µg), plus GPI-0100 (100 µg) (Galenica Pharmaceuticals Inc., Birmingham, AL); Group 5 – immunized with a mixture containing **104**, **105** and **106** (3 µg each), plus QS-21 (10 µg). Mice were immunized on days 1, 7, and 14, and bled 10 days after third vaccination. The presence of antibody is assayed by an enzyme linked immunosorbent assay (ELISA) as described previously (Ragupathi *et al. Angew. Chem. Int. Ed. Engl.* **1997**, *36*, 125) using the appropriate target antigen (*e.g.*, globo H-ceramide, Le<sup>y</sup> ceramide and/or Tn(c)-pamcys as target antigen). The

cell surface reactivity can then be tested, for example, the cell surface reactivity of anti- globo H, Le<sup>y</sup>, and Tn antibodies are tested on globo H, Le<sup>y</sup>, Tn positive cell-lines by flow cytometry assays (FACS).

**[0315] 3) Serological Analyses**

**[0316] Enzyme-Linked Immunosorbent Assay (ELISA).** ELISAs were performed as previously described (Ragupathi, G., Park, T. K., Zhang, S., Kim, I. J., Graber, L., Adluri, S., Lloyd, K. O., Danishefsky, S. J. & Livingston, P. O. (1997) *Angew. Chem. Int. Ed. Engl.* **36**, 125-128). Briefly, ELISA plates were coated with either synthetic Globo-H-ceramide, or Le<sup>y</sup> and Le<sup>b</sup> expressing mucin purified from ovarian cyst fluid (Lloyd, K. O., Kabat, E. A., Layug, E. J. & Gruezo, F. (1966) *Biochemistry* **5**, 1489-1501), or Tn-HAS, or Globo-H-Le<sup>y</sup>-Tn-HSA in 0.1 M carbonate buffer (pH 11), at 0.3 µg/well for glycolipids and 0.2 µg/well for glycoproteins. Serially diluted antiserum was added to each well, and alkaline phosphatase-conjugated goat anti-mouse IgM or anti-mouse IgG was added at a dilution of 1:200 (Southern Biotechnology Associates, Inc, Birmingham, AL). Absorbance was measured at 414 nm. ELISA titers are defined as the highest dilution yielding an absorbance of 0.1 or greater over that of normal control mouse sera.

**[0317] 4) Cell Surface Reactivity Determined by FACS.**

**[0318]** The cell surface reactivity of immune sera was tested on human cell lines as previously described (Ragupathi, G., Park, T. K., Zhang, S., Kim, I. J., Graber, L., Adluri, S., Lloyd, K. O., Danishefsky, S. J. & Livingston, P. O. (1997) *Angew. Chem. Int. Ed. Engl.* **36**, 125-128). Briefly, reactivity was assessed using anti-Globo-H, anti-Le<sup>y</sup>, and anti-Tn antibodies tested on MCF-7 (Globo-H and Le<sup>y</sup> positive) and LS-C (Tn and Le<sup>y</sup> positive) cells (provided by Dr. S. H. Itzkowitz, (Mt. Sinai Hospital, NY)) (Ogata, S., Chen, A. & Itzkowitz, S. H. (1994) *Cancer Res.* **54**, 4036-4044). Single cell suspensions of 2 x 10<sup>5</sup> cells/tube were washed in PBS with 3% fetal calf serum (FCS) and 0.01M NaN<sub>3</sub> and incubated with 20 µl of 1:20 diluted antisera or monoclonal antibodies for 30 min on ice. The positive control mAbs were VK-9 against synthetic Globo-H (Kudryashov, V., Ragupathi, G., Kim, I. J.,

Breimer, M. E., Danishefsky, S. J., Livingston, P. O. & Lloyd, K. O. (1998) *Glycoconjugate Journal* **15**, 243-249), 3S193 against Le<sup>y</sup> (Hellstrom, I., Garrigues, H. J., Garrigues, U. & Hellstrom, K. E. (1990) *Cancer Res.* **50**, 2183-2190), and  $\alpha$ Tn against Tn (DAKO Corporation, Carpinteria, CA). After two washes with 3% FCS in PBS, 20  $\mu$ l of 1:15 diluted goat anti-mouse IgM or IgG-labeled with fluorescein-thiocyanate (FITC) was added, and the mixture incubated for 30 min. After a final wash, the positive population and mean fluorescence intensity of stained cells were differentiated using FACScan (Becton & Dickinson, CA).

**[0319]**            **5) Discussion of Immunological Studies**

**[0320]**            As discussed above, in one aspect of the invention, multiantigenic glycopeptides are provided. In certain exemplary embodiments, the inventive multiantigenic glycopeptides are trimeric constructs and comprise three different carbohydrate domains found on tumor cell surfaces. In one embodiment, as shown on Figure 23, the inventive glycopeptides comprise a TF, a Tn and an Le<sup>y</sup> epitope (construct **61**). In another embodiment, the inventive glycopeptides comprise a Globo-H, a Tn and an Le<sup>y</sup> epitope (construct **63**).

**[0321]**            In the study described herein, the immunological properties of **64** when administered in the presence of QS-21 (Kensil, C. R., Patel, U., Lennick, M. & Marciani, D. (1991) *J. Immunol.* **146**, 431-437) were examined, or, for comparison purposes, when administered in the presence of the related, but less toxic adjuvant GPI-0100 (Marciani, D. J., Press, J. B., Reynolds, R. C., Pathak, A. K., Pathak, V., Gundy, L. E., Farmer, J. T., Koratich, M. S. & May, R. D. (2000) *Vaccine* **18**, 3141-3151). As controls, the immunogenicity of the non-conjugated compound **62** was evaluated, and a concurrent investigation on a mixture containing each of the monomeric antigens conjugated to KLH (**104**, **105** and **106**, Figure 25) was conducted. The later experiment was conducted for the purposes of comparing the response by a *single* mouse to *each* of the individual antigens, in response to vaccination with the polyvalent construct versus the mixture of monomers. In order to address issues relating to vaccine formulation, the level of immune response directed against each antigen, within the construct was determined. Furthermore, in

anticipation of clinical trials, the ability of antibodies, so generated, to react in vitro with human cell lines known to express the individual antigens was assessed.

[0322] In certain other embodiments, the inventive glycopeptides are conjugated to a suitable carrier either directly, or indirectly through a linker or linker-crosslinker moiety. As discussed above, the carrier may be a protein, polypeptide or a lipid. In certain exemplary embodiments, the inventive glycopeptides are conjugated to the highly immunogenic protein carrier KLH. Vaccine candidates **63** and **64** were prepared by conjugating the totally synthetic glycopeptides **61** and **62**, respectively, to the highly immunogenic protein carrier KLH. QS-21, or the related compound GPI-0100, was used as an adjuvant in order to enhance the immune response against the tumor-associated antigens present in the constructs. Initial ELISA investigations (data not shown) of the two potential conjugate vaccines indicated that construct **64** was superior to **63** from an immunological standpoint, and, consequently, construct **64** was thoroughly investigated. Remarkably, antibodies raised in response to **64** were not only able to identify the individual antigens in ELISAs but, as determined by FACS analysis, they also reacted strongly with tumor cells known to selectively express each tumor-associated antigen.

[0323] Numerous factors could influence the magnitude of the antibody response against individual antigens when more than one antigen is administered during vaccination. The combination of separate pathogen vaccines, such as diphtheria, tetanus, acellular pertussis, hepatitis A, haemophilus influenzae, type b-tetanus toxoid conjugate, and inactivated poliomyelitis, generally results in similar antibody responses against the individual components, whether they are administered separately, simultaneously, or sequentially (Jones, I. G., Tyrrell, H., Hill, A., Horobin, J. M. & Taylors, B. (1988) *Vaccine* **16**, 113; Usonis, V., Bakasenas, V., Williams, P. & Clemens, R. (2000) *Vaccine* **18**, 947-954; and Kanra, G., Silier, T., Yurdakok, K., Yavuz, T., Baskan, S., Ulukol, B., Ceyhan, M., Ozmert, E., Turday, F. & Pehlivan, T. (1999) *Vaccine* **18**, 947-954). Similarly, combining purified bacterial capsular polysaccharides does not seem to reduce the immunogenicity of the individual polysaccharide components. By contrast, for conjugate vaccines, several factors could potentially negatively impact the antibody

response to individual antigens, especially when monomeric conjugate vaccines are combined and administered using a cocktail-like approach (See, for example, Anderson, P. (1983) *Infection & Immunity* **39**, 233-238; Kurika, S. (1996) *Vaccine* **14**, 1239-1242; Barington, T., Gyhrs, A., Kristensen, K. & Heilmann, C. (1994) *Infection & Immunity* **62**, 9-14; Peters, C. C., Tenbergen-Meeks, A. M., Poolman, J. T., Beurret, M., Zegers, B. J. M. & Rijkers, G. T. (1974) *Infect. Immun.* **59**, 3504-3510; Sarvas, H., Makela, O., Toivanen, P. & Toivanen, A. (1974) *Scand. J. Immunol.* **3**, 455-460; Fattom, A., Cho, Y. H., Chu, C., Fuller, S., Fries, L. & Naso, R. (1999) *Vaccine* **17**, 126-133; Barington, T., Skettrup, M., Juul, L. & Heilman, C. (1993) *Infect. Immun.* **61**, 432-438; Cross, A. M., Artenstein, A., Qu, J. & *et al.* (1994) *Journal of Infectious Diseases* **170**, 834-840; Sarnaik, S., Kaplan, J., Schiffman, G., Bryla, D., Robbins, J. B. & Schneerson, R. (1990) *Pediatric Infectious Disease* **9**, 181-186; and Molrine, D. C., Tarbell, G. S. & *et al.* (1995) *Annals of International Medicine* **123**, 828-834).

[0324] In some instances, exposure to a carrier appears to produce an amplified response upon subsequent challenge, thereby resulting in increased antibody production against antigens conjugated to the same carrier protein (see, Anderson, P. (1983) *Infection & Immunity* **39**, 233-238; Kurika, S. (1996) *Vaccine* **14**, 1239-1242). In other cases, prior exposure to a carrier results in increased antibody levels only against the carrier and not to the conjugated antigens (See, Barington, T., Gyhrs, A., Kristensen, K. & Heilmann, C. (1994) *Infection & Immunity* **62**, 9-14; Peters, C. C., Tenbergen-Meeks, A. M., Poolman, J. T., Beurret, M., Zegers, B. J. M. & Rijkers, G. T. (1974) *Infect. Immun.* **59**, 3504-3510; Sarvas, H., Makela, O., Toivanen, P. & Toivanen, A. (1974) *Scand. J. Immunol.* **3**, 455-460). Combining conjugate vaccines containing the same carrier, or simultaneous administration of the carrier in non-conjugated form, may result in a decreased antibody response against the target antigens (See, Fattom, A., Cho, Y. H., Chu, C., Fuller, S., Fries, L. & Naso, R. (1999) *Vaccine* **17**, 126-133; Barington, T., Skettrup, M., Juul, L. & Heilman, C. (1993) *Infect. Immun.* **61**, 432-438; Cross, A. M., Artenstein, A., Qu, J. & *et al.* (1994) *Journal of Infectious Diseases* **170**, 834-840; Sarnaik, S., Kaplan, J., Schiffman, G., Bryla, D., Robbins, J. B. & Schneerson, R. (1990) *Pediatric Infectious Disease* **9**, 181-186; and Molrine, D. C., Tarbell, G. S. &

*et al.* (1995) *Annals of International Medicine* **123**, 828-834). Without wishing to be bound to any particular theory, Applicant proposes that these complications could be avoided through combination of the various antigens on the same conjugate vaccine. There was a possibility that, upon combining several antigens within the same construct, the immune response against one or more of the members of that set could be suppressed. Additionally, cross-reactivity involving more than one antigen might be observed, which would be expected to result in a portion of the antibody population produced having reduced affinity to particular antigens displayed on the cell surface. With that in mind, the effect of the administration of a glycopeptide bearing different antigens on the immune response in subject was investigated. Significantly, the studies with compound **64** revealed that there was no substantial decrease in antibody titers over the course of immunizations with **64**. Furthermore, no indication of an impaired antibody response against the individual antigens within the construct was apparent, as assessed by ELISA and FACS analysis. In fact, the antibody response for each individual antigen within the clustered construct was similar to that observed when the mixture of individual monomers was administered. What is even more significant from a potential therapeutic point of view is that, compared to the mixture of monomers, antibodies raised to the multivalent construct exhibited equal or higher reactivity with human cell lines expressing the native antigens, as determined by FACS analysis. Interestingly, although relatively high ELISA-based antibody titers were observed when sera resulting from vaccination with the polyvalent construct were screened against the polyvalent construct itself (see Table 5), FACS-based analyses (see Table 6) showed that that sera reacted just as well as sera derived from the monomers. The ELISA-based data in this case would seem to suggest that there was, indeed, cross-reactivity of antibodies between the antigens in the multivalent construct. However, the FACS data clearly indicate that this cross-reactivity does not negatively impact recognition of the antigens on the cell surface.

[0325] *Antibody Response against Globo-H-Le<sup>y</sup>-Tn construct (62).* ELISA antibody titers against Globo-H-Le<sup>y</sup>-Tn in sera from mice immunized with **64** was determined and results are summarized in Table 5. Relatively strong IgM and IgG titers were detected in mice vaccinated with **64**, compared to pre-vaccination sera

which showed no IgG and IgM titers. Construct **64** induced both IgM and IgG antibodies, with the GPI-0100 group inducing significantly higher titers compared to the QS-21 group. Group 5 induced very low IgM and IgG titers against the multivalent construct (see Table 5), when compared with groups 3 and 4.

[0326] *Antibody Response against Globo-H ceramide.* ELISA antibody titers against Globo-H-ceramide in sera from mice immunized with **64** were determined. As summarized in Table 5, weak IgM titers were detected in pre-vaccination sera, while sera obtained after vaccination with **64** showed increased IgM and IgG titers. No difference in IgM titers between groups 3 and 4 was detected. However, the group receiving QS-21 induced IgG antibodies against Globo-H, whereas the group receiving GPI-0100 failed to do so. Sera obtained from group 5 reacted strongly with Globo-H, relative to all other groups.

[0327] *Antibody Response against Le<sup>y</sup>.* ELISA antibody titers against Le<sup>y</sup> in sera from mice immunized with **64** were tested and the results are summarized in Table 5. With the exception of group 1, no detectable anti-Le<sup>y</sup> antibodies were present in pre-vaccination sera. In general, sera obtained following vaccination with **64**, or a mixture of three vaccines, reacted relatively strongly with Le<sup>y</sup> by ELISA. Construct **64** induced both IgM and IgG antibodies against Le<sup>y</sup>. No difference in antibody production was observed between groups 3 and 4, having received QS-21 and GPI-0100, respectively. No difference in antibody titers was observed between mice immunized with construct **62**, or with a mixture containing monomeric constructs **104**, **105**, and **106**.

[0328] *Antibody Response against Tn antigen.* ELISA antibody titers against Tn-HSA in sera from mice immunized with **64** and mixture of constructs **104**, **105**, and **106** were determined. As summarized in Table 5, no IgM or IgG activity was detected in pre-vaccination sera. Groups 3 and 4 induced both IgM and IgG titers against Tn, but the adjuvant GPI-0100 induced one fold higher titer than adjuvant QS-21. Group 5 also showed high IgG titers against Tn antigen.

[0329] *Cell surface reactivities.* Cell surface reactivity of the sera was tested by flow cytometry using MCF-7 (Globo-H, Le<sup>y</sup> and Tn positive) and LS-C (Tn and Le<sup>y</sup> positive) cell lines. The results are summarized in Table 6, and the histograms of FACS against MCF-7 for groups 3, 4 and 5 are presented in Figure 25. Sera

obtained from all pre-vaccinated mice showed minimal reactivity (<10% positive cells). Following vaccination, groups 3, 4 and 5 showed significant IgM reactivity and low IgG reactivity against MCF-7 cells. No significant difference in cell surface reactivity against MCF-7 was observed with sera obtained after vaccination with construct **64** (group 3) or a mixture of constructs **104**, **105**, and **106** (group 5). There also did not appear to be a difference in cell surface reactivity between the adjuvants QS-21 (group 3) and GPI-0100 (group 5).

[0330] Without wishing to be bound to any particular theory, Applicant proposes that the lack of suppression of the antibody response against these multiantigenic vaccines may be due to the KLH/adjuvant combination (See, for example, Helling, F., Shang, A., Calves, M., Zhang, S., Ren, S., Yu, R. K., Oettgen, H. F. & Livingston, P. O. (1994) *Cancer Research* **54**, 197-203; Kim, S. K., Ragupathi, G., Musselli, C., Choi, S. J., Park, Y. S. & Livingston, P. O. (2000) *Vaccine* **18**, 597-603; and Kim, S., Ragupathi, G., Cappello, S., Kagan, E. & Livingston, P. O. (2000) *Vaccine* **19**, 530-537). The use of KLH as carrier and QS-21 as adjuvant has been shown to result in a potent helper T cell type-1 response (See Helling, F., Shang, A., Calves, M., Zhang, S., Ren, S., Yu, R. K., Oettgen, H. F. & Livingston, P. O. (1994) *Cancer Research* **54**, 197-203). This is likely the case for GPI-0100 as well, given its close structural relationship to QS-21. It has been reported that KLH is more effective as an immunogenic carrier than are a variety of other standard proteins. It has also been demonstrated that for GD3-KLH and MUC1-KLH conjugates, adjuvants such as QS-21 induce a 1000-100,000 fold augmentation of antibody responses in the mouse, compared to the use of the conjugates alone (See Kim, S. K., Ragupathi, G., Musselli, C., Choi, S. J., Park, Y. S. & Livingston, P. O. (2000) *Vaccine* **18**, 597-603; and Kim, S., Ragupathi, G., Cappello, S., Kagan, E. & Livingston, P. O. (2000) *Vaccine* **19**, 530-537). However, since our goal in the present study was primarily that of determining whether a multivalent conjugate vaccine could be administered without clear loss of immunogenicity against the individual components, we did not attempt to saturate the system.

[0331] Several other observations are noteworthy. Since GPI-0100 is less toxic than QS-21, greater quantities of GPI-0100 could be safely administered to the mice, and this resulted in a commensurate increase in antibody production. Also regarding antibody production, in general, construct **63** produced lower titers than **64**. The structural differences between **63** and **64** may account for the immunological variance observed for these vaccines. Compound **63** is a more accurate mimic of mucin glycoproteins. Clustered glycoamino acids containing the mucin  $\alpha$ -O-linked GalNAc core are highly rigidified, even in the case of very short glycopeptides, as a result of specific interactions between the glycan and peptide backbone (Don M. Coltart, Ajay K. Royyuru, Lawrence J. Williams, Peter W. Glunz, Dalibor Sames, Scott D. Kuduk, Jacob B. Schwarz, Xiao-Tao Chen, Samuel J. Danishefsky, David H. Live *J. Am. Chem. Soc.* In press). Thus, as a result of such structurally-based interactions, use of a mucin mimic that is faithful to the known architectural features of the cell surface molecule might impede the identification of the individual constituent antigens displayed on the peptide backbone during the immune response. In addition, the close resemblance of the structural core of the mucin-based vaccine construct (**63**) to self antigens within the mice, might make it more difficult to break tolerance.

[0332] In summary, single vaccine constructs bearing several different carbohydrate antigens such as those described herein, have the potential to stimulate a multifaceted immune response, necessary for optimal targeting of the heterogenous population of cells associated with a particular cancer type. Thus, since Globo-H, Le<sup>y</sup>, and Tn are each over-expressed on prostate cancer, vaccination with **64** could potentially induce a broader range of antibodies, which will have a greater likelihood of accomplishing immunosurveillance against a greater range of aberrant cells. One of ordinary skill in the art will appreciate that the methods disclosed herein for the preparation of these constructs disclosed herein, as well as methods disclosed elsewhere (see, for example, Williams, L. J., Harris, C. R., Glunz, P. W. & Danishefsky, S. J. (2000) *Tetrahedron Lett.* **41**, 9505-9508; Allen, J. R., Harris, C. A. & Danishefsky, S. J. (2001) *J. Am. Chem. Soc.* **123**, 1890-1897 and U.S. Patent Application Nos.: 09/083,776 and 09/276,595) are readily adaptable to the inclusion

of more complex patterns of glycosylation and more elaborate peptide motifs, which might activate other elements of the immune system.

# Claims

1. A compound having the structure:

wherein  $L^1$  is a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety;

each occurrence of  $R_x$  is independently hydrogen or a protecting group;

wherein  $R$  is hydrogen; substituted or unsubstituted alkyl; alkenyl; aryl;  $-CH_2CH(CO_2R')(NHR'')$ , wherein  $R'$  or  $R''$  are each independently hydrogen, protecting group, substituted or unsubstituted alkyl, aryl, peptide, protein or lipid; or an immunogenic carrier linked to  $L^1$  directly or through a crosslinker.

2. The compound of claim 1 wherein  $L^1$  is  $-O-(CH_2)_n-$  and the compound has the structure:

wherein,  $n$  is an integer from 0-9, and  $R$  and  $R_x$  are as defined in claim 1.

3. The compound of claim 1, wherein  $L^1$  comprises a glycoside moiety.
4. The compound of claim 3, wherein the glycoside moiety is a monosaccharide.
5. The glycopeptide of claim 4, wherein the monosaccharide is a moiety having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group, and  $R_y$  is a nitrogen protecting group.

6. The compound of claim 1, wherein  $R$  is  $-\text{CH}_2\text{CH}(\text{CO}_2\text{R}')(\text{NHR}'')$ - and the compound has the structure:

wherein  $R'$  and  $R''$  are each independently hydrogen or a suitable protecting group, and  $R_x$  and  $L^1$  are as defined in claim 1.

7. The compound of claim 6, wherein  $L^1$  is  $-\text{O}(\text{CH}_2)_n-$  and the compound has the structure:

wherein  $n$  is an integer from 0-8 and  $R'$  and  $R''$  are each independently hydrogen or a suitable protecting group.

8. The compound of claim 6 or 7, wherein  $R'$  and  $R''$  are each protecting groups independently selected from the group consisting of Fmoc, acetyl, Benzyl, Boc, *t*-butyl, Cbz and TSE.
9. The compound of claim 7, wherein  $n$  is 3.
10. The compound of claim 1, wherein  $R$  is an immunogenic carrier.
11. The compound of claim 10 wherein the immunogenic carrier is a protein, peptide or lipid.
12. The compound of claim 11 wherein the carrier is KLH, polylysine or BSA.
13. The compound of claim 11 wherein the lipid has the structure:

wherein  $m'$ ,  $n'$  and  $p'$  are each independently integers between about 8 and 20; and  $R_v$  is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl.

14. The compound of claim 13, wherein  $m'$ ,  $n'$  and  $p'$  are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine.

15. A multi-antigenic glycopeptide comprising a peptidic backbone made up of two or more amino acids, wherein one or more of said amino acids is/are independently substituted with a glycosidic moiety having the structure:

wherein  $L^1$  is a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_6$ ,  $R_7$ ,  $R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures

represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

wherein at least one occurrence of A is a carbohydrate domain having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group.

16. The glycopeptide of claim 15 wherein at least one occurrence of  $L^1$  is  $-O-(CH_2)_n-$ .
17. The glycopeptide of claim 16, wherein n is 3.
18. The glycopeptide of claim 15, wherein at least one occurrence of  $L^1$  comprises a glycoside moiety.
19. The glycopeptide of claim 18, wherein the glycoside moiety is a monosaccharide.

20. The glycopeptide of claim 19, wherein the monosaccharide is a moiety having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group, and  $R_y$  is a nitrogen protecting group.

21. The glycopeptide of claim 15, wherein said glycopeptide is a construct having the structure:

wherein  $q$  is 0 or 1;

$m$  is an integer from 1-20;

$R$  is hydrogen or an immunogenic carrier;

the linker is either  $-O-$ , (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated alkyl, aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1

or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $COOH$ ,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen,  $CHO$ ,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; wherein the glycosidic moiety is either  $\alpha$ - or  $\beta$ -linked to an amino acid; and wherein at least one occurrence of A is a carbohydrate moiety having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group.

22. The glycopeptide of claim 21 wherein the linker is  $-O-$ ,  $-NR_G-$ ,  $-NR_G(\text{aliphatic})NR_J-$ ,  $-NR_G(\text{heteroaliphatic})NR_J-$ ,  $-(\text{aliphatic})NR_J-$ ,  $-(\text{heteroaliphatic})NR_J-$ ,  $-O(\text{aliphatic})NR_J-$ ,  $-O(\text{heteroaliphatic})NR_J-$ ,  $-NR_G(\text{aliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-NR_G(\text{heteroaliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-(\text{aliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-(\text{heteroaliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-O(\text{aliphatic})NR_J(C=O)(CR_HR_I)_kS-$ ,  $-O(\text{heteroaliphatic})NR_J(C=O)(CR_HR_I)_kS-$ , an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of k is independently 1-5; wherein each occurrence of  $R_G$ ,  $R_H$ ,  $R_I$  or  $R_J$  is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or

acyclic moiety, or a substituted or unsubstituted aryl moiety, and wherein each aliphatic or heteroaliphatic moiety is independently substituted or unsubstituted, linear or branched, cyclic or acyclic.

23. The glycopeptide of claim 21, wherein the linker is  $-O-$ ,  $-NR_G(CR_HR_I)_kNR_J-$ ,  $-NR_G(CR_HR_I)_kNR_J(C=O)(CR_HR_I)_kS-$ ,  $-NR_G-$ ,  $-(CR_HR_I)_kNR_I-$ ,  $-O(CR_HR_I)_kNR_J$ , an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester, wherein each occurrence of  $k$  is independently 1-5, wherein each occurrence of  $R_G$ ,  $R_H$ ,  $R_I$  or  $R_J$  is independently hydrogen, a linear or branched, substituted or unsubstituted, cyclic or acyclic moiety, or a substituted or unsubstituted aryl moiety.

24. The glycopeptide of claim 21, wherein  $q$  is 1 and the crosslinker is a fragment having the structure:

whereby said structure is generated upon conjugation of maleimidobenzoic acid N-hydroxy succinimide ester with a linker.

25. The glycopeptide of claim 21 wherein  $R$  is hydrogen and  $q$  is 0.

26. The glycopeptide of claim 21 wherein  $R$  is an immunogenic carrier.

27. The compound of claim 26 wherein the immunogenic carrier is a protein, peptide or lipid.

28. The compound of claim 27 wherein the carrier is KLH, polylysine or BSA.

29. The compound of claim 27 wherein q is 0 and the lipid has the structure:

wherein  $m'$ ,  $n'$  and  $p'$  are each independently integers between about 8 and 20; and  $R_V$  is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl.

30. The compound of claim 29, wherein  $m'$ ,  $n'$  and  $p'$  are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine.
31. The glycopeptide of claim 21 wherein at least one occurrence of  $L^1$  is  $-O-(CH_2)_n-$ , wherein  $n$  is an integer from 0-9.
32. The glycopeptide of claim 31, wherein  $n$  is 3.
33. The glycopeptide of claim 21, wherein at least one occurrence of  $L^1$  comprises a glycoside moiety.
34. The glycopeptide of claim 33, wherein the glycoside moiety is a monosaccharide.
35. The glycopeptide of claim 34, wherein the monosaccharide is a moiety having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group, and  $R_y$  is a nitrogen protecting group.

36. The glycopeptide of claim 21, wherein each occurrence of A which is not a carbohydrate domain having the structure:

is independently Globo-H, fucosyl GM1, KH-1, glycophorin,  $Le^y$ , N3, Tn, STN, 2,6-STn, (2,3)ST, Gb3 or TF, wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group.

37. The glycopeptide of claim 21, wherein m is 2, at least one occurrence of  $L^1$  is  $-O(CH_2)_n-$ , wherein n is an integer from 0-9; and each occurrence of A is independently a carbohydrate domain having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group.

38. The glycopeptide of claim 21, wherein m is 2, at least one occurrence of  $L^1$  comprises a glycoside moiety, and each occurrence of A is independently a carbohydrate domain having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group.

39. The glycopeptide of claim 38, wherein the glycoside is a monosaccharide.
40. The glycopeptide of claim 39, wherein the monosaccharide is a moiety having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group, and  $R_y$  is a nitrogen protecting group.

41. The glycopeptide of claim 21 wherein  $m$  is 2, each occurrence of  $L^1$  is independently  $-O(CH_2)_n-$ , the glycopeptide has three occurrences of A comprising Gb3, and the glycopeptide has the structure:

wherein  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or a carrier protein, peptide or lipid, and each occurrence of  $R_x$  is independently hydrogen or a protecting group.

42. The glycopeptide of claim 21 wherein  $m$  is 2, each occurrence of  $L^1$  independently comprises a monosaccharide, the glycopeptide has three occurrences of  $A$  comprising Gb3, and the glycopeptide has the structure:

wherein  $q$  is 0 or 1; each occurrence of  $n$  is independently an integer from 0-9;  $R$  is hydrogen or a carrier protein, peptide or lipid, each occurrence of  $R_x$  is independently hydrogen or a protecting group, and  $R_y$  is a nitrogen protecting group.

43. The glycopeptide of claim 42, wherein each occurrence of  $n$  is 0.

44. The glycopeptide of claim 41, wherein each occurrence of  $n$  is 3.

45. The glycopeptide of claim 41 or 42, wherein  $q$  is 0.

46. The glycopeptide of claim 41 or 42, wherein  $R$  is KLH, Bovine Serum Albumin or polylysine.

47. The glycopeptide of claim 41 or 42, wherein the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$ ; wherein  $t$  and  $v$  are each independently integers from 1-6.
48. The glycopeptide of claim 41 or 42, wherein each occurrence of  $\text{R}_x$  is hydrogen.
49. The glycopeptide of claim 42, wherein each occurrence of  $\text{R}_y$  is Ac.
50. The glycopeptide of claim 41 or 42, wherein  $q$  is 1 and the crosslinker is a moiety having the structure:

whereby said structure is generated upon conjugation of a maleimidobenzoic acid N-hydroxy succinimide ester with a linker.

51. The glycopeptide of claim 42, wherein  $n$  and  $q$  are each 0,  $\text{R}$  is hydrogen and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each independently integers from 1-6.
52. The glycopeptide of claim 42, wherein  $n$  is 0,  $q$  is 1,  $\text{R}$  is KLH, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein  $t$  and  $v$  are each independently integers from 1-6, and the crosslinker is a moiety having the structure:

53. The glycopeptide of claim 41, wherein q is 0, n is 3, R is hydrogen and the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein t and v are each independently integers from 1-6.

54. The glycopeptide of claim 41, wherein q is 1, n is 3, R is KLH, the linker is a moiety having the structure  $-\text{NH}(\text{CH}_2)_t\text{NHC}(=\text{O})(\text{CH}_2)_v\text{S}-$  wherein t and v are each independently integers from 1-6, and the crosslinker is a moiety having the structure:

55. The glycopeptide of any one of claims 47, 51-54 wherein t is 3 and v is 1.

56. A glycopeptide having the structure:

wherein q is 0 or 1;

m is an integer from 5-20;

R is hydrogen or an immunogenic carrier;

the linker is either  $-\text{O}-$ , (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of  $A$  is independently a carbohydrate domain having the structure:

wherein  $a, b, c, d, e, f, g, h, i, x, y$  and  $z$  are independently 0, 1, 2 or 3, with the proviso that the  $x, y$  and  $z$  bracketed structures represent furanose or pyranose moieties and the sum of  $b$  and  $c$  is 1 or 2, the sum of  $d$  and  $f$  is 1 or 2, and the sum of  $g$  and  $i$  is 1 or 2, and with the proviso that  $x, y$  and  $z$  are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{13}$ ,  $R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen,  $COOH$ ,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group; and wherein the glycosidic moiety is either  $\alpha$ - or  $\beta$ -linked to an amino acid.

57. A synthetic construct having the structure:

wherein  $n$  is 0-8; wherein the carrier a lipid or protein linked directly or through a crosslinker; each occurrence of  $R_x$  is independently hydrogen or a protecting group; and wherein  $t'$  is at least 1.

58. The construct of claim 57, wherein  $t'$  is in the range of 20 to 600.
59. The construct of claim 57, wherein  $n$  is 4.
60. The glycopeptide of claim 21 or 56, wherein each occurrence of  $R_A$  and  $R_C$  is independently hydrogen or methyl.
61. A method for the synthesis of a glycoamino acid comprising steps of:
- providing a suitable alkenyl glycoside;
  - providing a suitably protected alkenylamino acid;
  - reacting said alkenyl glycoside with the alkenylamino acid suitable conditions in the presence of a suitable catalyst to generate a glycoenamide ester; and
  - subjecting the glycoenamide ester to suitable conditions to generate a glycoamino acid.

62. The method of claim 61 wherein:

the alkenyl glycoside of step (a) has the structure:

wherein  $n$  is 0-8;

$A$  is a carbohydrate domain having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein R<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub> and R<sub>9</sub> is independently hydrogen, OH, OR<sup>i</sup>, NHR<sup>i</sup>, NHCOR<sup>i</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>i</sup>, a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sup>i</sup> is independently hydrogen, CHO, COOR<sup>ii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

the alkenylamino acid of step (b) is an alkenylglycine having the structure:

wherein R' and R'' are each independently hydrogen or a protecting group and q' is an integer from 0-8;

the glycoenamide ester generated in step (c) has the structure:

wherein R' and R'' are each independently hydrogen or a protecting group, and n and q' are each independently an integer from 0-8; and

the glycoamino acid generated in step (d) has the structure:

wherein R' and R'' are each independently hydrogen or a protecting group, and n and q' are each independently an integer from 0-8.

63. The method of claim 61, wherein A is selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN, (2,3)ST, Le<sup>y</sup>, N3, Tn, STn, 2,6-STn, Gb3 and TF.

64. The method of claim 61, wherein A is a carbohydrate determinant having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group; and wherein each occurrence of  $R_y$  is independently hydrogen or a nitrogen protecting group.

65. The method of claim 61, wherein A is a carbohydrate determinant having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group, and wherein  $R_y$  is hydrogen or a nitrogen protecting group.

66. The method of claim 61, wherein A is a carbohydrate determinant having the structure:

wherein each occurrence of R<sub>x</sub> is independently hydrogen or a protecting group.

67. The method of claim 61, wherein the catalyst of step (a) is selected from the group consisting of:

and

;

wherein Cy represents a cyclohexyl moiety.

68. The method of claim 61, wherein the catalyst of step (a) has the structure:

wherein Cy represents a cyclohexyl moiety.

69. The method of claim 61, wherein the step of reacting said glycoamide ester under suitable conditions to generate a glycoamino acid comprises reacting said enamide ester under hydrogenation conditions and subsequent reaction under deprotection conditions to generate a glycoamino acid.

70. A pharmaceutical composition comprising:  
a compound or glycopeptide of claim 1, 15, 21 or 56, and  
a pharmaceutically suitable carrier.
71. The pharmaceutical composition of claim 70, wherein the compound or glycopeptide is conjugated to an immunogenic carrier.
72. A pharmaceutical composition comprising:  
a pharmaceutically acceptable carrier;  
an immunogenic carrier; and  
a multi-antigenic glycopeptide comprising a peptidic backbone made up of two or more amino acids, wherein one or more of said amino acids is/are independently substituted with a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of

$R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein  $R'_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_{10}, R_{11}, R_{12}, R_{13}, R_{14}$  and  $R_{15}$  is independently hydrogen, OH,  $OR^{iii}$ ,  $NHR^{iii}$ ,  $NHCOR^{iii}$ , F,  $CH_2OH$ ,  $CH_2OR^{iii}$ , or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R_{16}$  is hydrogen, COOH,  $COOR^{ii}$ ,  $CONHR^{ii}$ , a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of  $R^{iii}$  is hydrogen, CHO,  $COOR^{iv}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of  $R^{ii}$  and  $R^{iv}$  are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

whereby the glycopeptide has not been conjugated to the immunogenic carrier.

73. The pharmaceutical composition of claim 72, wherein each occurrence of A is independently Globo-H, fucosyl GM1, KH-1, glycophorin, STN,  $Le^y$ , N3, Tn, 2,6-STn, (2,3)ST, Gb3 or TF.

74. The pharmaceutical composition of claim 71 or 72, wherein the immunogenic carrier is bovine serum albumin, polylysine or keyhole limpet hemocyanin.

75. The pharmaceutical composition of claim 71 or 72, wherein q is 0 and the immunogenic carrier is a lipid having the structure:

wherein  $m'$ ,  $n'$  and  $p'$  are each independently integers between about 8 and 20; and  $R_V$  is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl.

76. The pharmaceutical composition of claim 75, wherein m', n' and p' are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine.

77. The pharmaceutical composition of claim 71 or 72, further comprising one or more immunological adjuvants.

78. The pharmaceutical composition of claim 77, wherein at least one of said one or more immunological adjuvants is a saponin adjuvant.

79. The pharmaceutical composition of claim 78, wherein the saponin adjuvant is GPI-0100.

80. The pharmaceutical composition of claim 77, wherein at least one of said one or more immunological adjuvants is bacteria or liposomes.

81. The pharmaceutical composition of claim 80, wherein the immunological adjuvant is *Salmonella minnesota* cells, bacille Calmette-Guerin or QS21.
82. A method of treating cancer in a subject suffering therefrom comprising:  
administering to a subject a therapeutically effective amount of a compound or glycopeptide of claim 1, 15, 21 or 56,  
and a pharmaceutically suitable carrier.
83. The method of claim 82, wherein the compound or glycopeptide is conjugated to an immunogenic carrier.
84. The method of claim 82, wherein the compound or glycopeptide has not been conjugated to a carrier, and the method further comprises administering an immunogenic carrier.
85. The method of claim 82, wherein said method comprises preventing the recurrence of cancer in a subject.
86. The method of claim 82 or 85, wherein the cancer is a solid tumor.
87. The method of claim 82 or 85, wherein the subject is in clinical remission, or where the subject has been treated by surgery, has limited unresected disease.
88. A method of inducing antibodies in a subject, wherein the antibodies are capable of specifically binding with tumor cells, which comprises administering to the subject an amount of a compound or construct of claim 1, 15, 21 or 56 effective to induce the antibodies.
89. The method of claim 88, wherein the glycopeptide is conjugated to an immunogenic carrier.

90. A method of inducing antibodies in a subject, wherein the antibodies are capable of specifically binding with tumor cells, which comprises administering to the subject:

an amount of a multi-antigenic glycopeptide comprising a peptidic backbone made up of two or more amino acids, wherein one or more of said amino acids is/are independently substituted with a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of A is independently a carbohydrate determinant having the structure:

wherein a, b, c, d, e, f, g, h, i, x, y and z are independently 0, 1, 2 or 3, with the proviso that the x, y and z bracketed structures represent furanose or pyranose moieties and the sum of b and c is 1 or 2, the sum of d and f is 1 or 2, and the sum of g and i is 1 or 2, and with the proviso that x, y and z are not simultaneously 0; wherein  $R_0$  is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of  $R_1, R_2, R_3, R_4, R_5, R_6, R_7, R_8$  and  $R_9$  is independently hydrogen, OH,  $OR^i$ ,  $NHR^i$ ,  $NHCOR^i$ , F,  $CH_2OH$ ,  $CH_2OR^i$ , a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of  $R^i$  is independently hydrogen, CHO,  $COOR^{ii}$ , or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group or a saccharide moiety having the structure:

wherein Y and Z are independently NH or O; wherein k, l, r, s, t, u, v and w are each independently 0, 1 or 2; with the proviso that the v and w bracketed structures represent furanose or pyranose moieties and the sum of l and k is 1 or 2, and the sum of s and u is 1 or 2, and with the proviso that v and w are not simultaneously 0; wherein R'<sub>0</sub> is hydrogen, a linear or branched chain alkyl, acyl, arylalkyl or aryl group; wherein each occurrence of R<sub>10</sub>, R<sub>11</sub>, R<sub>12</sub>, R<sub>13</sub>, R<sub>14</sub> and R<sub>15</sub> is independently hydrogen, OH, OR<sup>iii</sup>, NHR<sup>iii</sup>, NHCOR<sup>iii</sup>, F, CH<sub>2</sub>OH, CH<sub>2</sub>OR<sup>iii</sup>, or a substituted or unsubstituted linear or branched chain alkyl, (mono-, di- or tri)hydroxyalkyl, (mono-, di- or tri)acyloxyalkyl, arylalkyl or aryl group; wherein each occurrence of R<sub>16</sub> is hydrogen, COOH, COOR<sup>ii</sup>, CONHR<sup>ii</sup>, a substituted or unsubstituted linear or branched chain alkyl or aryl group; wherein each occurrence of R<sup>iii</sup> is hydrogen, CHO, COOR<sup>iv</sup>, or a substituted or unsubstituted linear or branched chain alkyl, acyl, arylalkyl or aryl group; and wherein each occurrence of R<sup>ii</sup> and R<sup>iv</sup> are each independently H, or a substituted or unsubstituted linear or branched chain alkyl, arylalkyl or aryl group;

whereby the glycopeptide has not been conjugated to an immunogenic carrier;

and

wherein the amount of glycopeptide is effective to induce the antibodies.

91. The method of claim 90, wherein the method further comprises administering an immunogenic carrier.

92. A method of inducing antibodies in a subject, wherein the antibodies are capable of specifically binding with tumor cells, which comprises administering to the subject an amount of a multi-antigenic glycopeptide effective to induce the antibodies, wherein the glycopeptide has the structure:

wherein  $q$  is 0 or 1;

$m$  is an integer from 1-20;

the linker is either  $-O-$ , (carboxamido)alkyl carboxamide, MBS, primary carboxamide, mono- or dialkyl carboxamide, mono- or diarylcarboxamide, linear or branched chain (carboxy)alkyl carboxamide, linear or branched chain (alkoxycarbonyl)alkyl-carboxamide, linear or branched chain (carboxy)arylalkylcarboxamide, linear or branched chain (alkoxycarbonyl)alkylcarboxamide, an oligoester fragment comprising from 2 to about 20 hydroxy acyl residues, a peptidic fragment comprising from 2 to about 20 amino acyl residues, or a linear or branched chain alkyl or aryl carboxylic ester;

each occurrence of  $R_A$  and  $R_C$  is independently hydrogen, a substituted or unsubstituted, linear or branched, cyclic or acyclic, saturated or unsaturated aliphatic or heteroaliphatic moiety or a substituted or unsubstituted aryl or heteroaryl moiety; and wherein each occurrence of  $R_D$  and  $R_F$  is independently a glycosidic moiety having the structure:

wherein each occurrence of  $L^1$  is independently a substituted or unsubstituted aliphatic or heteroaliphatic moiety;

each occurrence of  $A$  is independently a carbohydrate domain having the structure:

wherein the method further comprises administering an immunogenic carrier.

93. The method of any one of claims 90-92, wherein at least one occurrence of  $L^1$  is  $-O-(CH_2)_n-$ , wherein  $n$  is an integer from 0-9.

94. The method of claim 93, wherein  $n$  is 3.

95. The method of any one of claims 90-92, wherein at least one occurrence of  $L^1$  comprises a glycoside moiety.

96. The method of claim 95, wherein the glycoside moiety is a monosaccharide.

97. The method of claim 96, wherein the monosaccharide is a moiety having the structure:

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group, and  $R_y$  is a nitrogen protecting group.

98. The method of claim 90 or 92, wherein in the glycopeptide, each occurrence of  $A$  is independently a carbohydrate domain selected from the group consisting of Globo-H, fucosyl GM1, KH-1, glycophorin, STN,  $Le^y$ , N3, Tn, 2,6-STn, (2,3)ST, or TF, a carbohydrate domain having the structure:

or

wherein each occurrence of  $R_x$  is independently hydrogen or a protecting group;  
and wherein each occurrence of  $R_y$  is independently hydrogen or a nitrogen protecting group.

104. The method of claim 103, wherein the glycopeptide has the structure:

wherein  $n$  is an integer from 0-9, and  $t$  and  $v$  are each independently integers from 0-6.

105. The method of claim 90 or 92, wherein the glycopeptide has five occurrences of A comprising Globo-H, Le<sup>y</sup>, STn, TF and Tn, and the antibodies induced are those that recognize Globo-H, Le<sup>y</sup>, STn, TF and/or Tn antigens.

106. The method of claim 105, wherein the glycopeptide has the structure:

wherein n is an integer from 0-9, and t and v are each independently integers from 0-6.

107. The method of claim 82, 85, 88, 90 or 92, further comprising co-administering one or more immunological adjuvants.
108. The method of claim 107, wherein at least one of said one or more immunological adjuvants is a saponin adjuvant.
109. The method of claim 108, wherein said saponin adjuvant is GPI-0100.
110. The method of claim 107, wherein at least one of said one or more immunological adjuvants is bacteria or liposomes.
111. The method of claim 110, wherein the immunological adjuvant is *Salmonella minnesota* cells, bacille Calmette-Guerin or QS21.

112. The method of claim 110, wherein the immunological adjuvant is *Salmonella minnesota* cells, bacille Calmette-Guerin or QS21.
113. The method of claim 83, 84, 89, 91 or 92, wherein the immunogenic carrier is a protein, peptide or lipid.
114. The method of claim 113, wherein the carrier is KLH, BSA or polylysine.
115. The method of claim 113, the immunogenic carrier is a lipid having the structure:

wherein m', n' and p' are each independently integers between about 8 and 20; and R<sub>v</sub> is hydrogen, substituted or unsubstituted linear or branched chain lower alkyl or substituted or unsubstituted phenyl.

116. The method of claim 115, wherein m', n' and p' are each 14 and the lipid is tripalmitoyl-S-glycerylcysteinylserine.
117. The method of claim 92, wherein each occurrence of R<sub>A</sub> and R<sub>C</sub> is independently hydrogen or methyl.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 03/22657

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☒ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

**FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210**

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: Claims: 1-5 (partially), 6-9, 70-71 (partially), 82-89 (partially), 107-117 (partially)

Compounds, pharmaceutical compositions and methods related to the compound defined in claim 1, where R is hydrogen, substituted or unsubstituted alkyl, alkenyl, aryl or  $-CH_2CH(CO_2R')(NHR'')$ , with R' and R'' being independently hydrogen, a protecting group, substituted or unsubstituted alkyl or aryl and L1 is as defined claim 1.

2. Claims: Claims: 1-5 (partially), 15-56, 60, 70-71 (partially), 72-81, 82-89 (partially), 90-117

Compounds, pharmaceutical compositions, and methods related to the compounds defined in claims 1, 15 and 56, where R is hydrogen, substituted or unsubstituted alkyl, alkenyl, aryl or  $-CH_2CH(CO_2R')(NHR'')$ , with R' and R'' being independently peptide, protein or lipid.

3. Claims: Claims: 1 and 2 (partially), 10-14, 57-59, 70-71 (partially)

Compounds pharmaceutical compositions and methods related to the compound defined in claims 1 and 57, where R is an immunogenic carrier linked to L1 directly or through a crosslinker.

4. Claims: Claims: 61-69

Methods for the synthesis of a glycoamino acid using an alkenylamino acid.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

## Continuation of Box I.1

Although claims 82-117 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

-----

## Continuation of Box I.1

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

-----

## Continuation of Box I.2

Present claims 1-40, 56-117 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds in which A is chosen from Globo-H, fucosyl GM1, KH-1, glycophorin, STN, 2,3-ST, Ley, N3, Tn, STN, 2,6-STN, Gb3 and TF; for to the compounds referred to in claims 41-55, 64, 65, and 102-106 and in the examples.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
